## General information

Unless otherwise stated, all the reactions were carried out under an atmosphere of dry nitrogen or argon using oven-dried (120°C) glassware. Dichloromethane, dichloroethane and acetonitrile were distilled from calcium hydride. THF was distilled from sodium and benzophenone.

Analytical TLC was performed on ready-made plates coated with silica gel on aluminium (Merck 60 F<sub>254</sub>). Products were visualized by ultraviolet light and treatment either with *p*-anisaldehyde or phosphomolybdic acid stain followed by gentle heating or with iodine stain. Flash chromatography was performed using Merck silica gel 60 (230-400 mesh).

NMR spectra were recorded on a Bruker AV-400 spectrometer as solutions in deuteriochloroform ( $\text{CDCl}_3$ ), unless otherwise indicated.  $^1\text{H}$  and  $^{13}\text{C}$  chemical shifts are reported in parts per million (ppm) downfield to tetramethylsilane using the residual solvent signal as internal standard. Proton ( $^1\text{H}$ ) NMR information is given in the following format: multiplicity (s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet), coupling constant(s) ( $J$ ) in Hertz (Hz), number of protons. The prefix *app* is occasionally applied when the true signal multiplicity was unresolved and br indicates the signal in question broadened.

All melting points were recorded on Büchi apparatus with samples crystallized from hexane and are reported uncorrected. High-resolution mass spectra (HRMS) were recorded at the MS service of CEQMA (Centro de Química y Materiales de Aragón) in a Bruker Microtof-Q spectrometer by electrospray ionization (ESI).

**1*H*-Indole (1b)**, 2-methyl-1*H*-indole (**1h**), 1,2-dimethyl-1*H*-indole (**1i**), 1*H*-pyrrole (**5a**) *tert*-butyl diazoacetate (**2f**) and dimethyl diazomalonate (**2g**) were commercially available and they were used as received.

### Preparation of the catalysts CuO/SiO<sub>2</sub>, CuO<sub>x</sub>/SiO<sub>2</sub>-Al<sub>2</sub>O<sub>3</sub>, CuO/TiO<sub>2</sub>

Catalysts were prepared by the chemisorptions-hydrolysis method.<sup>1</sup> Three different supports were used: Silica gel (surface area: 300 m<sup>2</sup>/g, pore volume: 1.70 ml/g, mean pore radius: 114 Å), SiO<sub>2</sub>-AlO<sub>3</sub> (13% alumina, surface area: 485 m<sup>2</sup>/g, pore volume: 0.79 ml/g, mean pore radius: 33 Å) and TiO<sub>2</sub> (Degussa P-25 80% anatase, 20% rutile, surface area: 50 m<sup>2</sup>/g).

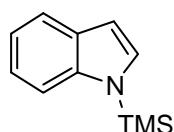

The powder was added to a [Cu(NH<sub>3</sub>)<sub>4</sub>]<sup>2+</sup> solution prepared by dropping aqueous NH<sub>3</sub> to a Cu(NO<sub>3</sub>)<sub>2</sub>·3H<sub>2</sub>O solution until pH 9 had been reached. After 20 min under stirring, the slurry, held in an ice bath at 273 K, was diluted with water. The solid was separated by filtration, washed with water, dried overnight at 383 K, and calcined in air at 673 K.

### Preparation of N-alkyl indole derivatives

To an ice-bath cooled suspension of washed NaH (1.2 equiv.) in THF was added dropwise the corresponding indole derivative (1 equiv.) at 0°C. The resulting mixture was stirred at 0°C for 30 min. and at room temperature for additional 30 min. After cooling to 0 °C, haloalkane (1.2-3 equiv.) was added and the solution was stirred at room temperature for 24h. Then a saturated aqueous solution of NH<sub>4</sub>Cl was added and the product was extracted with AcOEt. The combined organic phases were washed by water and brine, and dried over MgSO<sub>4</sub>. The product was then purified by flash chromatography.
