General Information. All moisture- and air-sensitive reactions were performed using syringe-septum cap techniques under an inert atmosphere ( $\mathrm{N}_{2}$ or argon) in glassware that was dried in an oven at $140{ }^{\circ} \mathrm{C}$ for at least 2 h prior to use. Reactions carried out at a temperature below $0{ }^{\circ} \mathrm{C}$ employed a brine/ice bath or a $\mathrm{CO}_{2} /$ acetone bath. All reagents and solvents were used as received unless otherwise specified. THF and $\mathrm{Et}_{2} \mathrm{O}$ were distilled over sodium/benzophenone ketyl; MeOH was distilled over magnesium; benzene, acetonitrile and DME were distilled over $\mathrm{CaH}_{2}$; DMF was distilled and stored over $4 \AA$ molecular sieves; pyridine and triethylamine were distilled over $\mathrm{CaH}_{2}$ and stored over $\mathrm{KOH} ; \mathrm{CH}_{2} \mathrm{Cl}_{2}$ and toluene were purified using an alumina column filtration system. Analytical thin-layer chromatography (TLC) was performed on pre-coated $\mathrm{SiO}_{2} 60 \mathrm{~F}_{254}$ plates ( $250 \mu \mathrm{~m}$ layer thickness) available from Merck. Visualization was accomplished by UV irradiation at 254 nm and/or by staining with Vaughn's reagent $\left(4.8 \mathrm{~g}\left(\mathrm{NH}_{4}\right)_{6} \mathrm{Mo}_{7} \mathrm{O}_{24} \cdot 4 \mathrm{H}_{2} \mathrm{O}\right.$ and 0.2 g $\mathrm{Ce}\left(\mathrm{SO}_{4}\right)_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}$ in 100 mL of a $3.5 \mathrm{~N} \mathrm{H}_{2} \mathrm{SO}_{4}$ solution), a $\mathrm{KMnO}_{4}$ solution ( $1.5 \mathrm{~g} \mathrm{KMnO}_{4}$ and $1.5 \mathrm{~g} \mathrm{~K}_{2} \mathrm{CO}_{3}$ in 100 mL of a $0.1 \% \mathrm{NaOH}$ solution), a ninhydrin solution ( 2 g ninhydrin in 100 mL EtOH ), a PMA solution ( 5 g phosphomolybdic acid in 100 mL EtOH ), or a $p$-anisaldehyde solution ( $2.5 \mathrm{~mL} p$-anisaldehyde, 2 mL AcOH and 3.5 mL conc. aq. $\mathrm{H}_{2} \mathrm{SO}_{4}$ in 100 mL EtOH ). Flash column chromatography was performed using $\mathrm{SiO}_{2} 60$ (particle size $0.040-0.055 \mathrm{~mm}, 230-400 \mathrm{mesh}$, or Silicycle SiliaFlash ${ }^{\circledR}$ P60, 40-63 $\mu \mathrm{m}$ ). Melting points were determined on a Laboratory Devices Mel-Temp II capillary melting point apparatus fitted with a Fluke 51 II digital thermometer. Optical rotations were determined using a PerkinElmer 241 polarimeter. Infrared spectra were recorded on a Smiths IdentifyIR ATR spectrometer. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were obtained on a Bruker Avance 300 or 400 instrument at $300 / 75 \mathrm{MHz}$ or $400 / 100 \mathrm{MHz}$, respectively. Chemical shifts were reported in parts per million ( ppm ) as referenced to residual solvent. ${ }^{1} \mathrm{H}$ NMR spectra are tabulated as follows: chemical shift, multiplicity (app = apparent, $\mathrm{b}=$ broad, $\mathrm{s}=\operatorname{singlet}, \mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, quint $=$ quintuplet, sext, $=$ sextuplet, $\mathrm{m}=$ multiplet , number of protons, coupling constant( s$).{ }^{13} \mathrm{C}$ NMR were obtained using a protondecoupled pulse sequence and are tabulated by observed peak. LC-MS analyses were performed on a Shimadzu UFLC instrument equiped with an Applied Biosystems MDS SCIEX API 2000 mass spectrometer (ESI), under the following conditions: column: Varian Polaris C18-A ( $100 \times 4.6 \mathrm{~mm}, 5 \mu \mathrm{~m}$ ) equilibrated at $40{ }^{\circ} \mathrm{C}$; buffer $\mathrm{A}: ~ 0.1 \%$ aqueous AcOH , buffer B: $0.1 \% \mathrm{AcOH}$ in $\mathrm{MeCN} ; 30 \mathrm{~min}$ gradient: $5 \%$ buffer B in buffer A for 1 min , then 5 to $95 \%$ buffer B in buffer A over 13 min , then $95 \%$ buffer B in buffer A for 4 min , then 95 to $5 \%$ buffer B in buffer A over 7 min , then $5 \%$ buffer B in buffer A for 5 min ; flow rate: $0.2 \mathrm{~mL} / \mathrm{min}$; detection: TIC and/or UV $\lambda=254 / 280 \mathrm{~nm}$. Mass spectra were obtained on a Waters Autospec double focusing mass spectrometer (EI) or a Waters Q-Tof mass spectrometer (ESI), at the University of Pittsburgh Mass Spectrometry facility. Experimental procedures and spectral details for compounds 11 and JP4-039 have previously been reported in Org. Lett. 2011, 13, 2318-2321.

2-Benzyl-1,1,3,3-tetramethylisoindoline. ${ }^{1}$ An oven-dried 250 mL , three-necked, round-bottom flask was flushed with nitrogen, and magnesium turnings ( $3.84 \mathrm{~g}, 156 \mathrm{mmol}$ ) were introduced, that were covered with dry $\mathrm{Et}_{2} \mathrm{O}(9 \mathrm{~mL})$. A solution of MeI $(9.45 \mathrm{~mL}, 150 \mathrm{mmol})$ in dry $\mathrm{Et}_{2} \mathrm{O}(80 \mathrm{~mL})$ was then added dropwise via a dropping funnel while stirring over a period of 50 min . The resulting reaction mixture was then stirred for an additional 30 min , and then concentrated by slow distillation of solvent until the internal temperature reached $80^{\circ} \mathrm{C}$. The residue was allowed to cool to $60^{\circ} \mathrm{C}$, and a solution of $N$-benzylphtalimide ( $6.00 \mathrm{~g}, 25.0 \mathrm{mmol}$ ) in dry toluene ( 76 mL ) was added dropwise via a dropping funnel with stirring at a sufficient rate to maintain this temperature. When the addition was complete, solvent was distilled slowly from the mixture until the temperature reached $108-110{ }^{\circ} \mathrm{C}$. The reaction mixture was refluxed at $110{ }^{\circ} \mathrm{C}$ for 4 h , then concentrated again by further solvent distillation. It was then cooled to rt and diluted with hexanes. The resulting purple slurry was filtered through Celite and washed with hexanes. The combined yellow filtrate turned dark red-purple after standing in air overnight. It was then concentrated in vacuo. The resulting purple residue was passed through a short column of basic alumina (grade I, 70-230 mesh), eluting with hexanes ( $\sim 1 \mathrm{~L}$ ), to afford $2.58 \mathrm{~g}(39 \%)$ of the title compound as a colorless oil which solidified to give a white solid. Representative experimental data are as follows: mp 61.0-61.4 ${ }^{\circ} \mathrm{C}$ (lit. $63-64{ }^{\circ} \mathrm{C}$ from MeOH or EtOH); IR (neat) 3081, 3062, 3047, 3019, 3006, 2978, 2965, 2958, 2918, 2890, 2849, 2820, $1485,1446,1379,1372,1355,1319,1299,1284,1265,1237,1211,1195,1176,1161,1140,1120,1103,1073,1045$, $1025,945,932,904,874,827,790,760,751,742,701,686 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.48(\mathrm{app} \mathrm{d}, 2 \mathrm{H}, J=7.2$ Hz ), 7.34-7.19 (m, 5 H), 7.18-7.11 (m, 2 H ), $4.00(\mathrm{~s}, 2 \mathrm{H}), 1.31(\mathrm{~s}, 12 \mathrm{H}) ;{ }^{13} \mathrm{C} \operatorname{NMR}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 148.0$, 143.6, 128.5, 128.1, 127.0, 126.5, 121.5, 65.4, 46.5, 28.6; EI-MS $m / z 265\left(\mathrm{M}^{+}, 25\right), 251$ (100), 235 (53), 158 (69), 144 (86), 128 (60), 115 (67), 103 (67), 92 (86), 77 (65), 65 (84); HRMS (EI) $m / z$ calcd for $\mathrm{C}_{19} \mathrm{H}_{23} \mathrm{~N} 265.1830$, found 265.1824.

The flasks were placed in 3 high pressure reactors. The reactors were charged with $\mathrm{H}_{2}$ and purged for 5 cycles and was finally pressurized with $\mathrm{H}_{2}$ at 4 bars ( 60 psi ). After stirring at rt for 3 h , the combined reaction mixtures were filtered through Celite, and the solvent removed in vacuo. The resulting residue was dissolved in water $(5 \mathrm{~mL})$ and the solution neutralized with 2.5 N aq. $\mathrm{NaOH}(\mathrm{pH}$ 11.5), and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 50 \mathrm{~mL})$. The combined organic layers were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo to yield $1.16 \mathrm{~g}(95 \%)$ of the crude title compound as slightly yellow crystals. Conc. $\mathrm{HNO}_{3}(0.90 \mathrm{~mL}, 19.1 \mathrm{mmol})$ was added dropwise via syringe. When the reaction appeared complete, the yellow-orange solution was heated at $100{ }^{\circ} \mathrm{C}$ for 10 min , the color turning to red-orange. After cooling to rt, the reaction mixture was neutralized by careful addition to ice-cooled $2.5 \mathrm{~N} \mathrm{aq} . \mathrm{NaOH}(30$ mL , final $\mathrm{pH}>12$ ). This aqueous phase was extracted with $\mathrm{Et}_{2} \mathrm{O}$ until it became colorless and the combined organic layers were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo to yield $1.64 \mathrm{~g}(98 \%)$ of crude 5-nitro-1,1,3,3-tetramethylisoindolin-2-yloxyl ${ }^{3}$ as a yellow-orange powder, that was carried on without further purification.

A solution of Bn-protected amine $18(150 \mathrm{mg}, 0.309 \mathrm{mmol})$ in $5: 1 \mathrm{MeCN} / \mathrm{H}_{2} \mathrm{O}(12 \mathrm{~mL})$ was treated with CAN $(339 \mathrm{mg}$, 0.618 mmol ). (5,7-Dibromo-adamantan-2-yl)-carbamic acid tert-butyl ester (20). ${ }^{6}$ The reaction was performed in 3 separated batches. For each of them, a suspension of the acid $19(7.80 \mathrm{~g}, 23.1 \mathrm{mmol})$ in dry toluene ( 117 mL ) was treated successively with $\mathrm{Et}_{3} \mathrm{~N}(3.9 \mathrm{~mL}, 27.7 \mathrm{mmol})$ and DPPA ( $6.20 \mathrm{~mL}, 27.7 \mathrm{mmol}$ ). To a separated flask containing a solution of $t$-BuOK ( $5.28 \mathrm{~g}, 46.1 \mathrm{mmol}$ ) in dry THF ( 312 mL ) at $0{ }^{\circ} \mathrm{C}$ was added the resulting isocyanate solution dropwise via a dropping funnel. The reaction mixture was allowed to warm to rt over 3 h , then quenched with water. The THF was removed in vacuo, and the resulting material was diluted with EtOAc. The organic layer was washed with 1 N aq. HCl , sat. aq. $\mathrm{NaHCO}_{3}$ and brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The crude residue was sonicated in a minimum of anhydrous $\mathrm{Et}_{2} \mathrm{O}$, filtered and washed with cold $\mathrm{Et}_{2} \mathrm{O}$ to yield 20 as a white powder. The 3 mother liquors were then combined and 2 additional filtrations afforded another fraction of $\mathbf{2 0}$ as an off-white powder. Chromatography of the residual mother liquor on $\mathrm{SiO}_{2}(9: 1$, hexanes/EtOAc) afforded a white powder contaminated with a yellow oil. This residue was taken up in hexanes, filtered, and the white powder washed with hexanes. This resulting white powder was only an impurity. The mother liquor was concentrated in vacuo and again taken up in a small amount of hexanes. The solvent was removed from the insoluble white powder with a Pasteur pipet, to separate the product from the yellow oil. The white powder was dried to yield an additional fraction of $\mathbf{2 0}$. The combined fractions afforded $21.6 \mathrm{~g}(77 \%)$ of $\mathbf{2 0}$ as a white powder. The crude mixtures were combined and the dioxane was removed in vacuo. The aqueous residue ( $\mathrm{pH}>12$ ) was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \mathrm{x})$. To a solution of this amine ( $2.98 \mathrm{~g}, 18.0 \mathrm{mmol}$, crude) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(270 \mathrm{~mL})$ was added $\mathrm{Et}_{3} \mathrm{~N}(7.60 \mathrm{~mL}, 54.0 \mathrm{mmol})$ and then $\mathrm{Boc}_{2} \mathrm{O}(4.37 \mathrm{~g}, 19.8 \mathrm{mmol})$ at $0{ }^{\circ} \mathrm{C}$. The reaction mixture was stirred at rt under nitrogen for 20 h , then quenched with sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}$. The aqueous phase was extracted twice with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, and the combined organic layers were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and concentrated in vacuo. The crude was taken up in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ but was poorly soluble. A filtration afforded a white powder. The mother liquor was evaporated and taken up in a 7:3 hexanes/EtOAc mixture. After sonicaton, the white powder was filtered. This procedure was repeated one more time. Chromatography of the resulting mother liquor on $\mathrm{SiO}_{2}$ ( $9: 1$ to $6: 4$, hexanes/EtOAc) afforded 964 mg of another fraction as a pale yellow powder. ## Irradiation survival curves in 32Dcl3 cells.

Procedure: Murine 32D cl 3 cells were suspended at $1 \times 10^{5}$ cells and irradiated to doses of irradiation ranging from 0 to 8 Gy using a J. L. Shepherd Mark I cesium irradiator at a dose rate of 72 cGy per min. In some groups, nitroxides were added at a concentration of $10 \mu \mathrm{M}$ either 1 h before irradiation or 10 min after irradiation. The cells were resuspended in methycellulose containing $10 \%$ serum and $15 \%$ WEHI- 3 conditioned medium as a source of IL3, and incubated at $37^{\circ} \mathrm{C}$ for 7 d , at which colonies of $>50$ cells were counted. The data was analyzed using linear quadratic and single-hit, multi-target models.

Data used to calculate $D_{0}$ and $\tilde{n}$ for Organic and Biomolecular Chemistry manuscript.
