## 1. General methods

All solvents and reagents were used as supplied. The commercially available reagents and solvents were employed without further purification. All reactions were performed in atmosphere unless noted. Column chromatography was performed with silica gel (200 - 300 mesh) produced by Qingdao Marine Chemical Factory, Qingdao (China). All yields were given as isolated yields.

## 2. Measurements

Melting points (Mp) were determined using a Focus X-4 apparatus (made in China) and were not corrected. NMR spectra were recorded on a Bruker DPX 300 MHz spectrometer and Bruker DPX 400 MHz with internal standard tetramethylsilane (TMS) and solvent signals as internal references. Chemical shifts ( $\delta$ ) are reported in ppm downfield from tetramethylsilane. Low-resolution electrospray ionization mass spectra (LR-ESI-MS) were obtained on Finnigan Mat TSQ 7000 instruments. High-resolution electrospray ionization mass spectra (HR-ESI-MS) were recorded on an Agilent 6540Q-TOF LCMS equipped with an electrospray ionization (ESI) probe operating in positive-ion mode with direct infusion.
