Experimental details (Page S116-S124)

Fig. S1 BH and HLYP/6-31G (d) computed transition states and activation energies of the C-C bond-forming step for the uncatalyzed and simplified model of chiral phosphoric acid-catalyzed Friedel-Crafts reaction between indole and acetophenone or 2,2,2-trifluoroacetophenone.

Note: Four transition states in the absence of the catalyst depending on the different orientations of the nucleophile and the electrophile for the reactions of indole with **3a** and **3b** has been localized and presented in **Fig. S1**. The notation used for the TSs, for example, “TS1” and “3a” in “TS1-3a-*anti*-exo-no” means the TS of the C-C bond forming step involved in the first Friedel-Crafts stage between **3a** and indole, “*anti*” denotes as the hydrogen atom of the C-H at β position in indole in the opposite direction as the oxygen atom of the carbonyl group, while “*exo*” means the aromatic ring of indole is in the same side with the phenyl group of ketone, “no” means the uncatalyzed process. As shown in **Fig. S1**, when the hydrogen atom of the C-H at β position in indole is in the same direction with the oxygen atom of the carbonyl moiety e.g. “TS1-*syn*-*exo*” and “TS1-*syn*-*endo*”, the four-membered-ring transition states for the reaction, in which the formation of the C-C bond and the hydrogen atom transfer take place simultaneously, have been characterized for the uncatalyzed Friedel-Crafts reaction of **3a** and **3b**. In these TSs, the C-C bond being formed is calculated to be 1.56~1.59 Å which indicates a very late transition state for the reaction, and the aromatic C-H bond has increased from 1.07 Å to 1.20~1.23 Å. The O-H bond going to be formed is around 1.57~1.64 Å while the carbonyl bond becomes 1.36 Å. The transition state energy is calculated to be 60~75 kcal/mol which is significantly high to be overcome. When the incoming C-H bond of indole is *anti* to the carbonyl group, whether for the substrate **3a** or **3b**,

the TSs are relatively earlier than the above *syn* ones. For example, in TSs involving **3a**, the lengths of the forming C-C bond are 1.69 Å and 1.70 Å in “*anti*”- TSs, while 1.56 Å and 1.57 Å in “*syn*”. The C=O bond changed to be about 1.30 Å in “*anti*” and about 1.36 Å in “*syn*”. The similar trend of the earlier *anti*-TSs has also been found for the reaction of indole with **3b**. Whether for CF₃ ketone or CH₃ ketone, the activation enthalpy of the *anti*-TSs is 15-20 kcal/mol lower than that of the *syn*-TSs. However, those *anti* barriers are still too high (around 40~60 kcal/mol) which is consistent with the fact that indole and **3a** or **3b** could not react in the absence of the catalyst.

Meanwhile, the corresponding TSs for this C-C bond-forming step of **3a** and **3b** in the presence of the simplified phosphoric acid model have also been illustrated in **Fig. S1**. Similar to the previous computational model in the chiral phosphoric acid-catalyzed Mannich, transfer hydrogenation, and hydrophosphonylation reactions etc.,⁷⁻¹³ the phosphoric acid also acts as a bifunctional catalyst, in which the acid proton of the catalyst activates the carbonyl group of the electrophile-ketone, while the phosphoryl oxygen atom forms hydrogen bond with the N-H moiety (or aromatic C-H) of the nucleophile-indole. Analogous to the uncatalyzed process, the relative orientation of C-H moiety at β-position in indole to the carbonyl group of ketone has great effect on the activation energy. The TSs involving the C-H *syn* to the C=O moiety are still much higher in energy (about 10~15 kcal/mol for CF₃ or CH₃ ketone) than those of the *anti* ones, which suggests the strong hydrogen bond donor ability of the NH moiety in indole. Therefore, the alternative mechanism of *syn*-channel in the phosphoric acid-catalyzed Friedel-Crafts reaction can be safely excluded and we only focus on the TSs of the *anti*-arrangements in the following discussion. Furthermore, as shown in **Fig. S1**, since indole is an unsymmetrical nucleophile, even keeping in the *anti*-conformation, there still have two orientations of the electrophile and nucleophile. We differentiate them as “*exo*” and “*endo*”. In the uncatalyzed process, the energy difference between “*exo*” and “*endo*” is relatively small, while in the presence of phosphoric

acid model, it increases with the “exo” orientation being more favorable than its “endo” counterpart. Hence, in the following description of the full mechanism in the paper, we have only used “**TS1-anti-exo**” as the reference point. Compared the activation energies of the phosphoric acid–catalyzed reaction with that of the catalyst-free process, we can see that the transition state is stabilized by 22.7 kcal/mol (33.5 kcal/mol) for **3a** (**3b**), which is significant enough to suggest that the reaction could indeed take place at the benign conditions in the presence of the phosphoric acid catalyst.. The calculated FMO energies, which clearly exhibit the lowering of the LUMO of the electrophile and the heightening of the HOMO of the nucleophile when going from the bare **3a** (LUMO: -0.9 eV), **3b** (LUMO:-0.1 eV), and indole (HOMO:-6.4 eV) to the phosphoric acid bonded **3a** (LUMO:-1.2 eV), **3b** (LUMO:-0.6 eV), and indole (HOMO:-6.0 eV) in **IN1a** and **IN1b**, also support the simultaneous activation role of the phosphoric acid catalyst to both of the reaction partners. Moreover, if the structure of “**TS1-anti-exo-3a**” is compared with “**TS1-anti-exo-3b**”, the major difference between the reaction involving **3a** and **3b** is the earlier stage of the C-C bond forming and the complete proton transfer from phosphoric acid to carbonyl group in the latter. The presence of the electron-withdrawing CF₃ group in the substrate can greatly reduce the activation barrier whether for the catalyzed or catalyst-free process, which confirmed that the trifluoroacetophenone can be more reactive than acetophenone in the Friedel-Crafts reaction. The significant lowering of the LUMO (π * C=O) energy from **3b** to **3a** for both the bare (-0.1 eV to -0.9 eV) and the phosphoric acid-bonded system (-0.6 eV in **IN1b** to -1.2 eV in **IN1a**) also suggests the more electrophilic nature of trifluoroacetophenone than acetophenone in the following nucleophilic addition process with indole because of the strong electron-withdrawing character of CF₃ group.

Fig. S2 BH and HLYP/6-31G (d) optimized structures of the intermediates and transition states for the simplified model of chiral phosphoric acid-catalyzed reaction between 2,2,2-trifluoroacetophenone and indole.

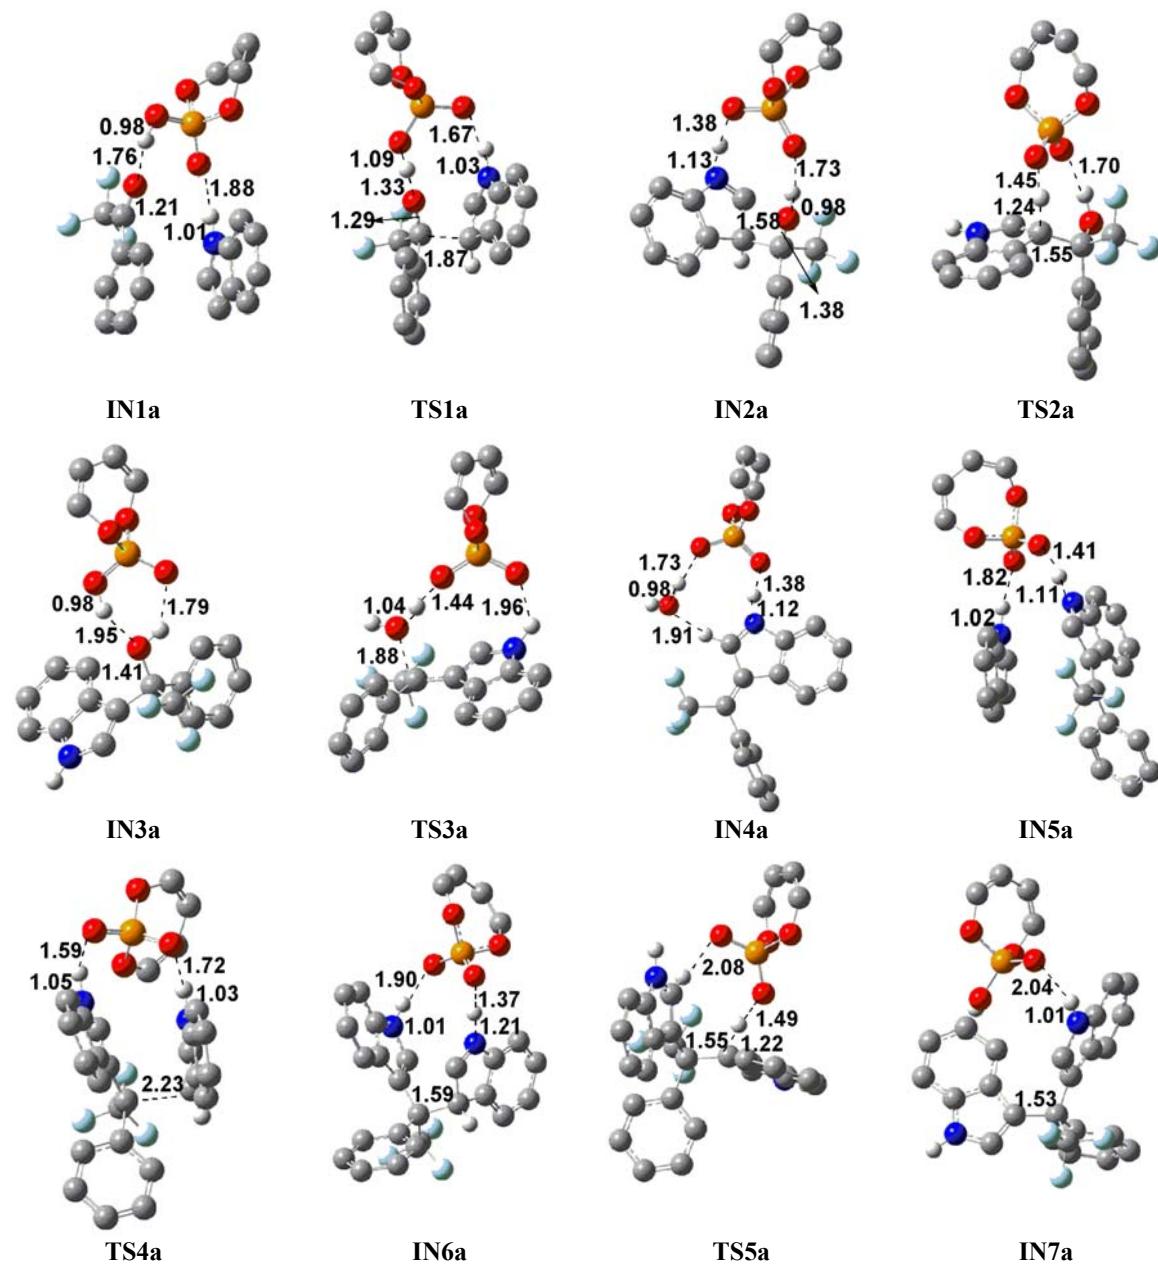

Figure S3. BH and HLYP/6-31G (d) optimized structures of the intermediates and transition states for the simplified model of chiral phosphoric acid-catalyzed reaction between acetophenone and indole.

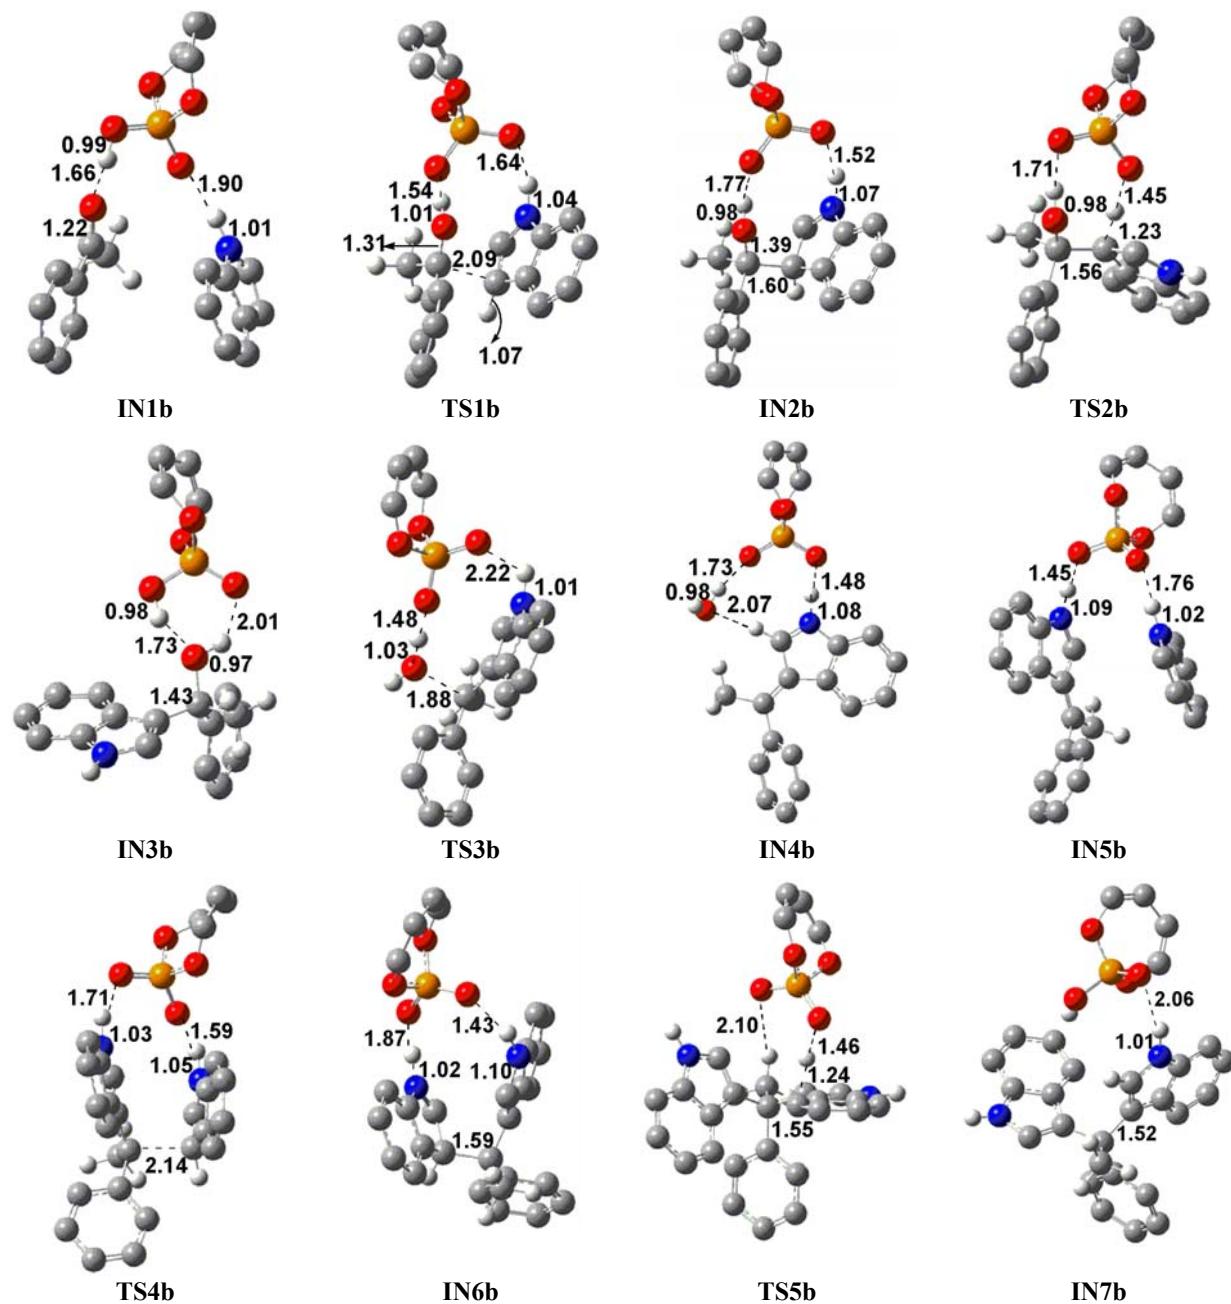

Fig. S4 BH and HLYP/6-31G (d) computed transition states and relative enthalpies for the C-C bond formation step of the simplified model (buta-1,3-diene-1,4-diol-phosphoric acid and biphenyl-phosphoric acid) of the chiral phosphoric acid-catalyzed Friedel-Crafts reaction between indole and 2,2,2-trifluoroacetophenone.

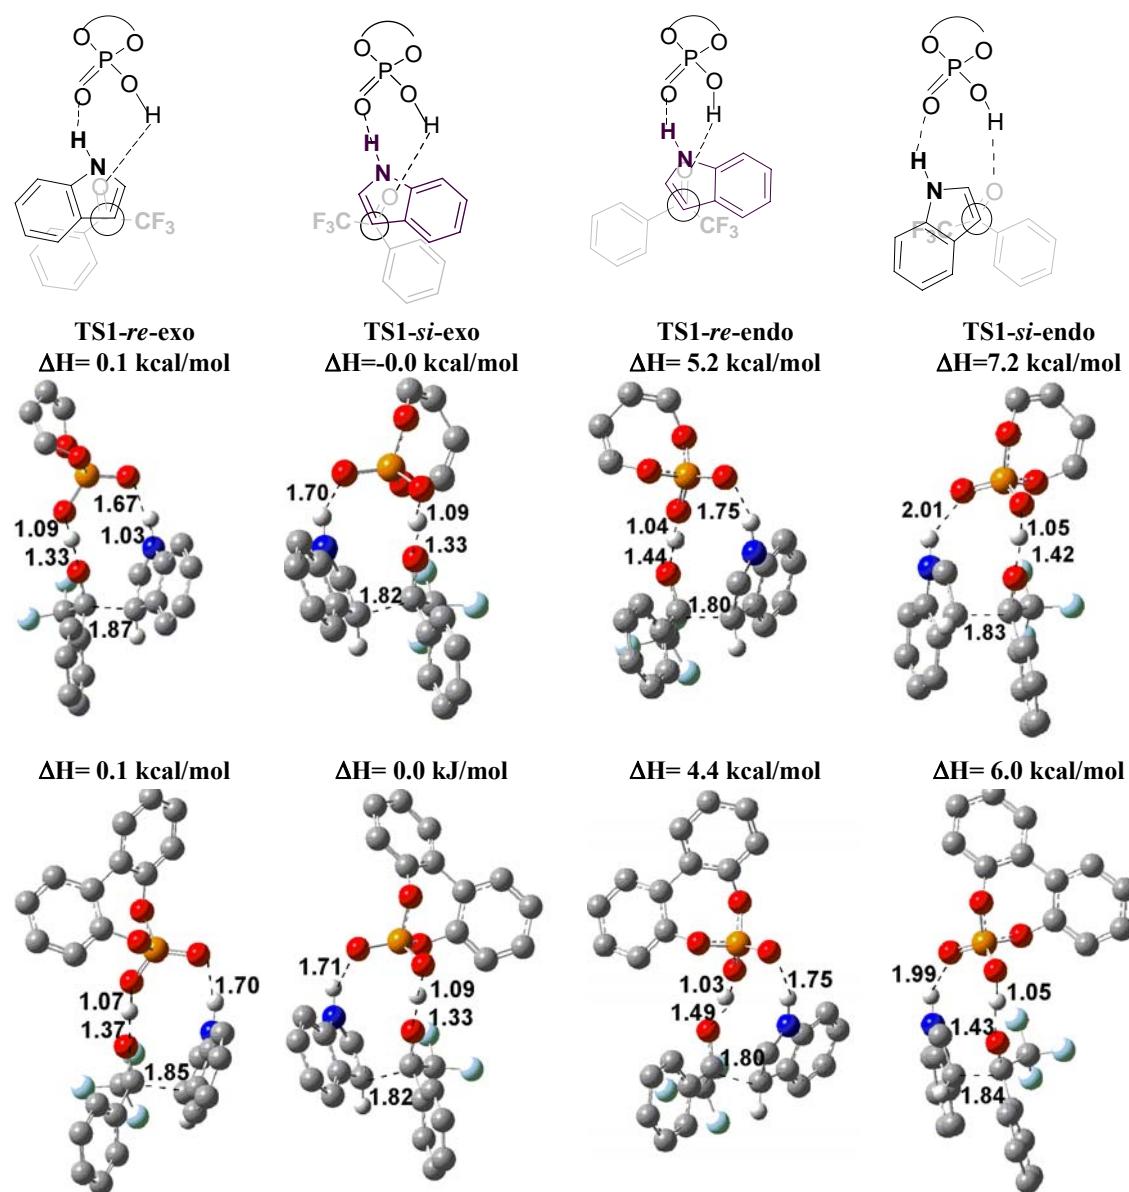

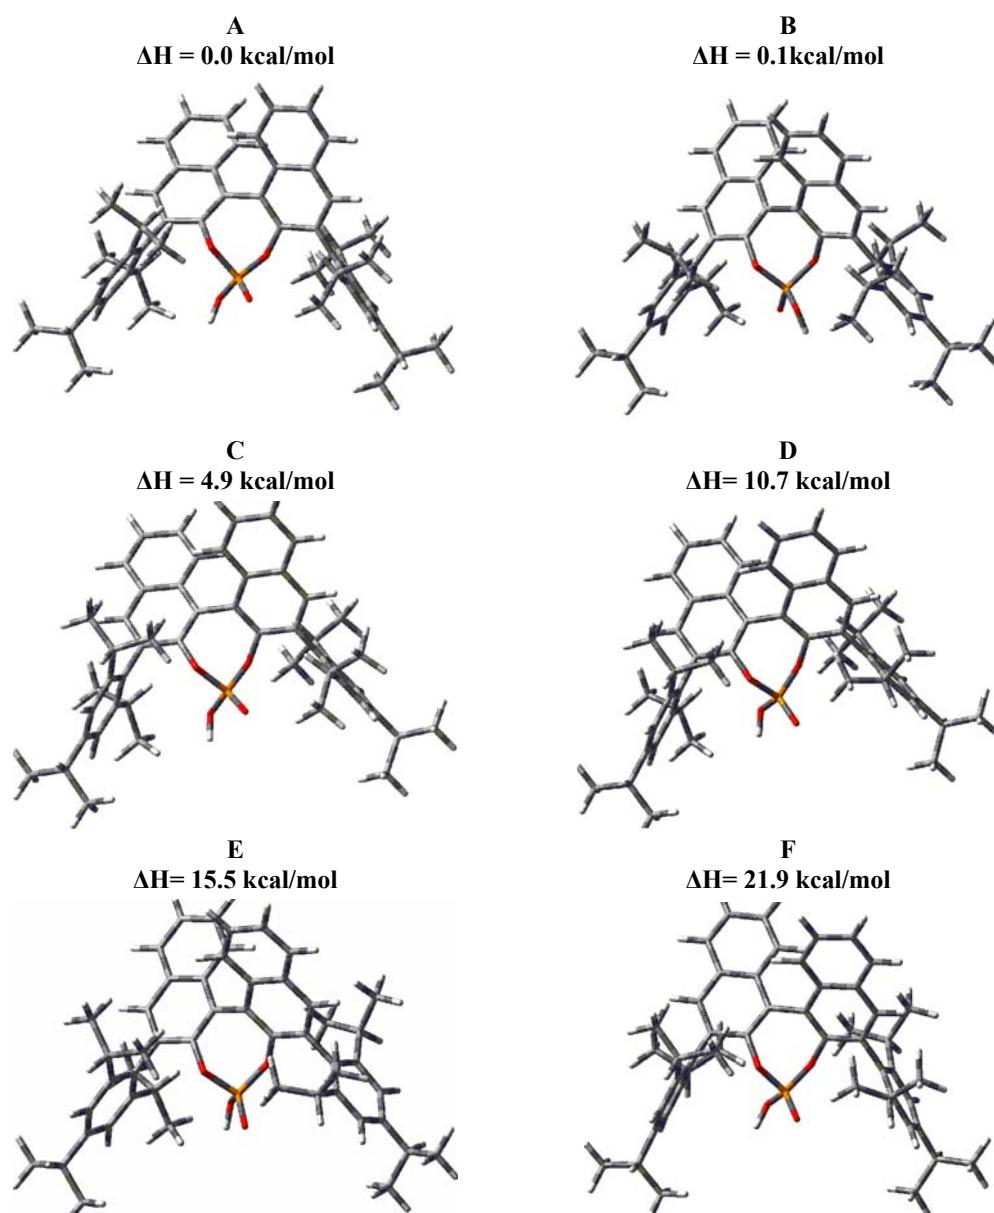

Table S1 Calculated LUMO energies (L_i :eV) and the activation enthalpies (ΔH_i^\ddagger : kcal/mol) of the electrophiles in the first and second C-C bond-formation steps for the F-substituted ketones and common ketones and the correlation between the L_i and H_i .

	ketone		IN1		Cation in IN5		Zwitterion IN5	
	L_i	ΔH_i^\ddagger	L_i	ΔH_i^\ddagger	L_i	ΔH_i^\ddagger	L_i	ΔH_i^\ddagger
CF ₃	-0.93	41.9	-1.2	19	-6.2	0.9	-2.4	15.3
CHF ₂	-0.72	47.8	-0.98	19.1	-6.0	3.7	-2.2	17.6
CH ₂ F	-0.44	54.3	-0.67	19.8	-5.7	5.7	-2.3	19.4
CH ₃	-0.15	56.1	-0.63	22.7	-5.6	11	-2.0	21.2
Correlation between ΔH_i^\ddagger and L_i	$\Delta H_i^\ddagger = 18.68L_i + 60.36$		$R^2 = 0.9052$		$\Delta H_i^\ddagger = 4.74L_i + 24.27$		$R^2 = 0.3150$	
					$\Delta H_i^\ddagger = 14.36L_i + 89.70$		$R^2 = 0.7900$	
					$\Delta H_i^\ddagger = 12.31L_i + 45.77$		$R^2 = 0.5427$	

Note: To understand the relationship between the reactivities and the electrophilicities of the electrophiles, we have calculated the LUMO energies of the zwitterion structures IN5 and the cations in IN5 (Scheme 1) for CF₃, CHF₂ and CH₂F ketones and the common methyl ketone. The computed LUMO energies (L_i :eV) and the activation enthalpies(ΔH_i^\ddagger : kcal/mol) for this second C-C bond-formation step are presented in **Table S1**. The linear correlation between ΔH_i^\ddagger and L_i has been analyzed according to Yu's semiempirical FMO theory.²⁰ As shown in the Table, there is slightly better linear correlation between the activation energies and the LUMO energies for the cations in IN5 than for the zwitterion structures IN5 which can be attributed to the complexity of the phosphoric acid anion interacting with the different cations. The similar analysis has been carried out for the four ketones and their IN1 counterparts. As expected, the LUMO energies of the ketones also have a linear correlation with the corresponding activation energies. The different hydrogen bond abilities of the F-substituted ketones and the common methyl ketone result in the poor linear correlation in IN1, analogues to the case of the zwitterion structures IN5.

Fig. S5 BH and HLYP/6-31G (d) computed geometries and relative enthalpies for different conformers of chiral phosphoric acid catalyst which is determined by the conformation of the isopropyl groups on the 2,4,6-triisopropylphenyl substituents.

Note: we can assume that the conformation of the chiral phosphoric acid catalyst will determine the stability of the related transition states and subsequently the enantioselectivity. Therefore, the different

conformers with respect to the isopropyl groups on the 2,4,6-triisopropylphenyl substituents of catalyst 1 have been investigated first.

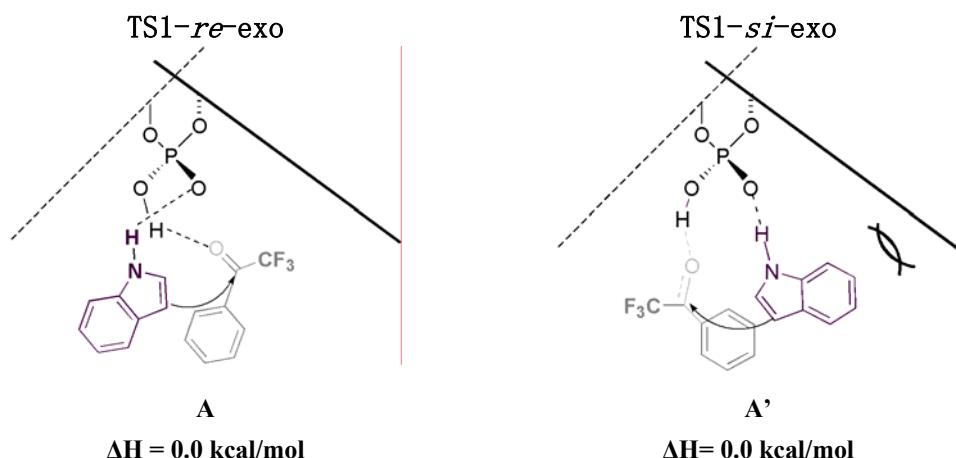

(1) The isopropyl group of the substituent contains two methyls and one H atom and the conformation with the isopropyl H eclipsed to the phenyl double bond is more favorable than the one with the methyl eclipsed to the phenyl double bond because of the significant steric interaction in the latter case.

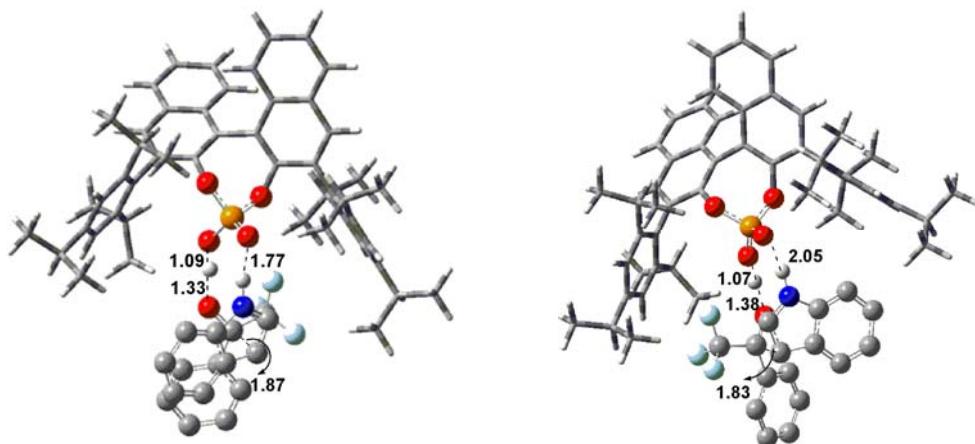

(2) Even all the six isopropyl groups adopt the preferred conformation as mentioned above, there still have different orientations of them. According to the calculations of the different structures for catalyst 1, we find that the most stable coformation **A** corresponds to the best orientation of the four isopropyl groups which are closer to the binaphthol backbone (2,2',6,6'-positions on the the substituents of 2,4,6-(i-Pr)₃C₆H₂) with all the four isopropyl H pointing to the binaphthol backbone side and the two isopropyl H which are far from the binaphthol backbone (4,4'- positions on the substituents of 2,4,6-(i-Pr)₃C₆H₂), pointing to the same direction. Structure **B** is nearly isoenergetic to **A** with the only difference of the two isopropyl H far from the binaphthol backbone (4,4'- positions) pointing to the opposite direction. Hence, with respect to the catalyst itself, the relative orientation of the isopropyl groups at the 4,4'-positions does not have obvious effect on the stabilization of the catalyst.

(3) From structures **C** to **F**, there are from one to four isopropyl Hs at the 2,2',6,6'-positions on the the substituents of 2,4,6-(i-Pr)₃C₆H₂ pointing to the opposite side of the binaphthol backbone. As shown in **Fig. S5**, because the two methyls of the isopropyl group are closer to the binaphthol core which will result in significant steric hindrance, these structures are greatly destabilized by 4.9, 10.1, 15.5, and 21.9 kcal/mol for conformer **C**, **D**, **E**, and **F** respectively. And as expected, the destabilization energies are proportional to the number of the isopropyl H at 2,2',6,6'-positions that points away from the binaphthol core. Based on the large energy difference between the different conformations, we can assume that conformers **C**, **D**, **E**, or **F** can be safely excluded in the reaction process.

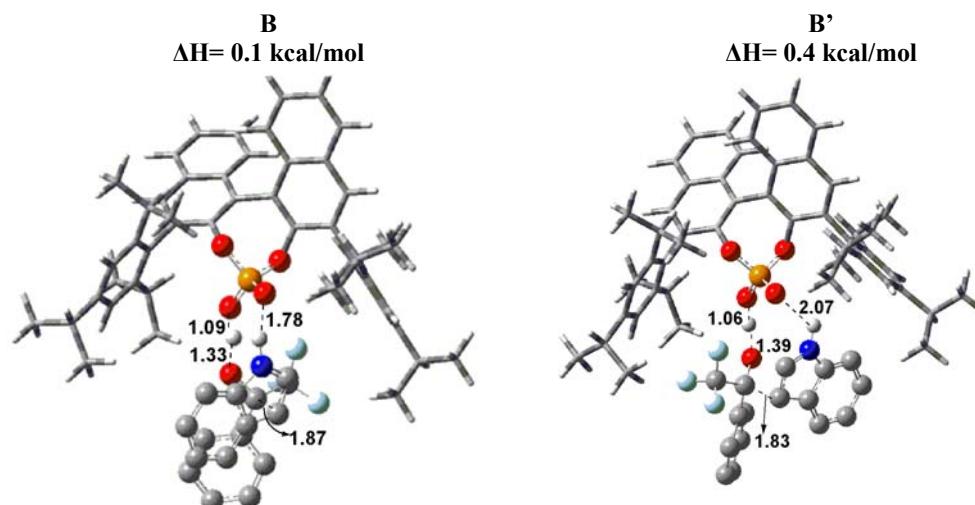

(4) To further verify our above assumption, we have located a transition state in the channel of TS1-*re*-exo which involves the conformer of the catalyst like structure **C** with one isopropyl H at the 2-position of 2,4,6-(i-Pr)₃C₆H₂ substituent pointing away from the binaphthol core. This TS is 5.8 kcal/mol higher in energy than its most stable counterpart in which all the four isopropyl H point to the binaphthol backbone side (like catalyst conformer **A** or **B**) in the TS1-*re*-exo channel. This energy difference between above two TSs is comparative to that between two conformers of the catalyst itself. Therefore, it can be concluded that in the enantio-determining C-C bond formation step, transition states involving the catalyst with the conformation of **C**, **D**, **E**, or **F** should be much higher in energy than the TSs containing conformation **A** or **B** of the catalyst, and those greatly destabilized TSs arising from the unstable conformation of the substituents on the catalyst can be safely excluded. Only TSs containing conformation **A** or **B** of the catalyst should be considered in the following discussion.

Fig. S6 Different conformers of the transition states arising from the relative orientations of the isopropyl groups at the 4,4'-positions on the 2,4,6-triisopropylphenyl substituents for the two lower-energy channels of the C-C bond formation step of chiral phosphoric-catalyzed Friedel-Crafts reaction (real system) between indole and 2,2,2-trifluoroacetophenone. Relative enthalpies at the ONIOM(BH and HLYP/6-31G(d):HF/3-21G) level are also shown.

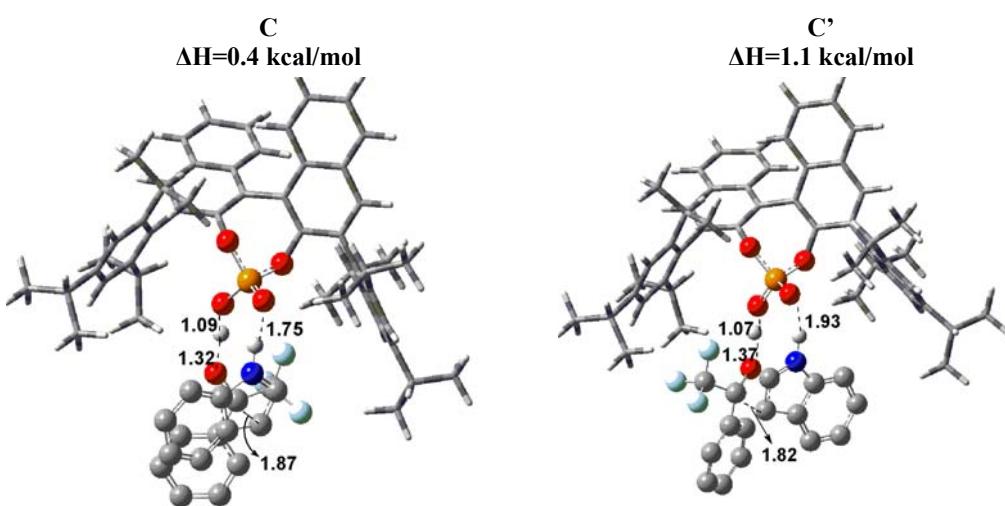

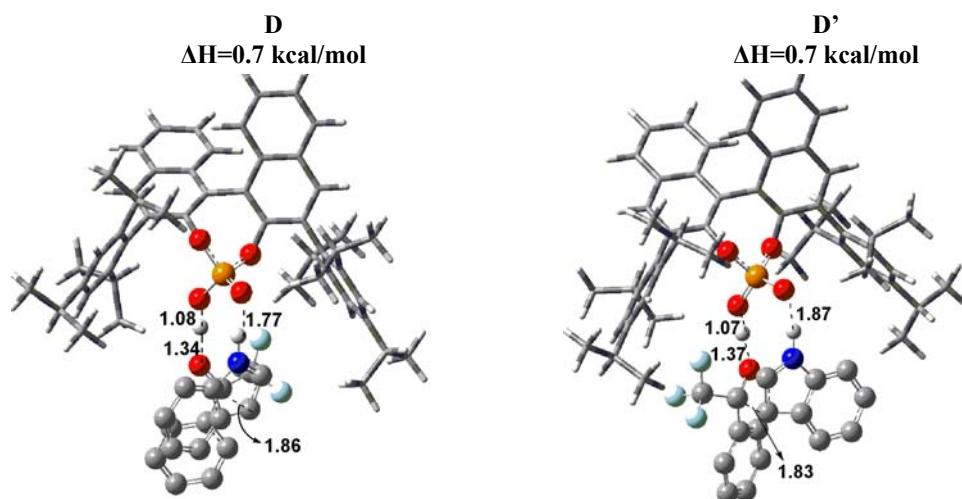

Two isopropyl Hs at 4,4'-positions both point to the bottom face

Of the two isopropyl Hs at 4,4'-positions, the right one points to the bottom face while the left one points to the top face

Two isopropyl Hs at 4,4'-positions both point to the top face

Of the two isopropyl Hs at 4,4'-positions, the right one points to the top face while the left one points to the bottom face

Note: As shown in **Fig. S6**, the conformational difference of the substituents at the 4,4'-positions of 2,4,6-triisopropylphenyl substituents on BINOLs catalyst also has effect on the stabilization of the transition states when they tried to accommodate the substrates into their chiral pockets. In those TSs, the higher-energy TSs correspond to the structures with larger deviation from the eclipsing conformation of the isopropyl Hs at 4,4'-positions to the phenyl double bond which is required to minimize the steric interaction between the steric substituents of the catalyst and the substrates. Obviously, these energy differences are much less than those arising from the unstable conformation of isopropyl groups at 2,2',6,6'-positions. It should also be noted that only the most stable conformers of the TSs corresponding to different reaction channels have been discussed in the paper (**Fig. 3**).

E. Cartesian coordinates and total energies of the reported key transition states and intermediates involved in the first C-C bond forming and dehydration steps for the simplified model of chiral phosphoric acid-catalyzed diarylation reaction between 2,2-difluoroacetophenone and indole at BH and HLYP/6-31G(d) level.

F. Cartesian coordinates and total energies of the reported key transition states and intermediates involved in the first C-C bond forming and dehydration steps for the simplified model of chiral phosphoric acid-catalyzed diarylation reaction between 2-fluoroacetophenone and indole at BH and HLYP/6-31G(d) level.

Experimental details

1. General information:

All reactions were performed under an Ar atmosphere in oven-dried glassware with magnetic stirring. Reactions were monitored through thin-layer chromatography (TLC). Chromatograms were visualized by fluorescence quenching under UV light at 254 nm. ^1H and ^{13}C NMR were recorded on Varian Mercury Plus 400 instruments at 400 MHz (^1H NMR) and 100 (^{13}C NMR). Chemical shifts were reported in ppm down field from internal Me₄Si. Multiplicity was indicated as follows: s (singlet), d (doublet), t (triplet), q (quartet), m (multiplet), dd (doublet of doublet), br (broad). Coupling constants were reported in Hertz (Hz). HRMS were recorded on an IonSpec FT-ICR mass spectrometer with EI resource.

2. Materials:

Unless otherwise stated, all solvents and reagents were purchased from commercial suppliers and used without further purification. Dichloromethane and chloroform employed in the reactions was freshly distilled from CaH₂. Analytical thin layer chromatography was performed on 0.20 mm Qingdao Haiyang

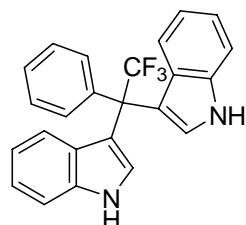

silica gel plates. Silica gel (200-300 mesh) (from Qingdao Haiyang Chem. Company, Ltd.) was used for flash chromatography.

3. Experimental procedures and characterization data

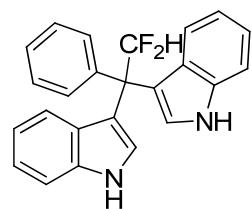

3.1 General procedures and supplementary information in the experimental section

3.1.1 General procedures for diarylation reaction

To a flame-dried Schlenk tube was added indole (0.14 mmol), 2,2,2-trifluoro-1-(1*H*-indole-3-yl)-1-phenylethanol or 2,2-difluoro-1-(1*H*-indole-3-yl)-1-phenylethanol (0.14 mmol), racemic phosphoric acid **1**, and solvent (toluene, 1 mL). After the solution was stirred at 80 °C under an argon atmosphere for stated time, the reaction mixture was concentrated, and the residue purified through flash column chromatography (Hexane/EtOAc= 20/1 to 4/1 as eluent) to give the product.

3,3'-(2,2,2-trifluoro-1-phenylethane-1,1-diyl)bis(1H-indole): white solid, Yield: 98%; ¹H NMR (400 MHz, CDCl₃) δ (ppm): 6.82 (d, *J* = 2.4 Hz, 2H), 6.98 (t, *J* = 7.6 Hz, 2H), 7.20 (t, *J* = 7.6 Hz, 2H), 7.25 (d, *J* = 8.4 Hz, 2H), 7.31 (s, 1H), 7.33-7.36 (m, 4H), 7.58 (d, *J* = 7.2 Hz, 2H), 7.99 (s, 2H); ¹³C NMR (100 MHz, CDCl₃) δ (ppm): 65.7, 111.2, 115.5, 119.7, 122.0, 122.4 (d, *J* = 3.0 Hz), 126.4 (d, *J* = 5.9 Hz), 127.6, 128.0, 129.6, 136.7, 139.3; ¹⁹F NMR (376 MHz, CDCl₃) δ (ppm): -62.4 (s, 3F); HRMS (EI): calcd for C₂₄H₁₆F₃N₂⁺ [M-H]⁺ 389.3924, found: 389.3921.

3,3'-(2,2-difluoro-1-phenylethane-1,1-diyl)bis(1H-indole): white solid, Yield: 95%; ^1H NMR (400 MHz, CDCl_3) δ (ppm): 6.90 (t, $J = 56$ Hz, 1H), 6.87 (d, $J = 2.4$ Hz, 2H), 6.92 (t, $J = 7.6$ Hz, 2H), 7.13-7.19 (m, 4H), 7.29 (t, $J = 3.2$ Hz, 3H), 7.35 (d, $J = 8$ Hz, 2H), 7.48-7.51 (m, 2H), 8.06 (s, 2H); ^{13}C NMR (100 MHz, CDCl_3) δ (ppm): 53.7, 111.2, 116.6, 118.7, 119.6, 122.0 (d, $J = 7.4$ Hz), 125.6, 126.6, 127.1, 128.0, 129.5, 136.8, 140.5; ^{19}F NMR (376 MHz, CDCl_3) δ = 116.53 (d, $J = 259.5$ Hz, 2F); HRMS (EI): calcd for $\text{C}_{24}\text{H}_{17}\text{F}_2\text{N}_2^-$ [M-H]⁻ 371.4020, found: 371.4022.
