I. General Methods and Materials. Unless stated otherwise, reactions were performed in flame-dried glassware. Analytical thin layer chromatography (TLC) was performed on precoated silica gel 60 F₂₅₄ plates and visualization on TLC was achieved by UV light (254 and 354nm). Flash column chromatography was undertaken on silica gel (400-630 mesh). ¹H NMR was recorded on 400 MHz or 300 MHz and chemical shifts were quoted in parts per million (ppm) referenced to the appropriate solvent peak or 0.0 ppm for tetramethylsilane. The following abbreviations were used to describe peak splitting patterns when appropriate: br = broad, s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, dd = doublet of doublet. Coupling constants, *J*, were reported in hertz unit (Hz). ¹³C NMR was recorded on 100 MHz and was fully decoupled by broad band proton decoupling. Chemical shifts were reported in ppm referenced to the center line of a triplet at 77.0 ppm of chloroform-*d*. Mass spectral data were obtained from the KAIST Basic Science Institute by using ESI method. Commercial grade reagents and solvents were used without further purification except as indicated below. Dichloromethane was distilled from calcium hydride. Unless otherwise stated, all commercial reagents and solvents were used without additional purification.

[a] Reaction conditions: benzamide (0.1 mmol), benzoquinone (0.2 mmol), catalyst, oxidant, and solvent (0.35 mL) at an indicated temperature for 1 h. [b] Yields are reported after isolation and purification by flash silica gel chromatography. N.R. = no reaction.

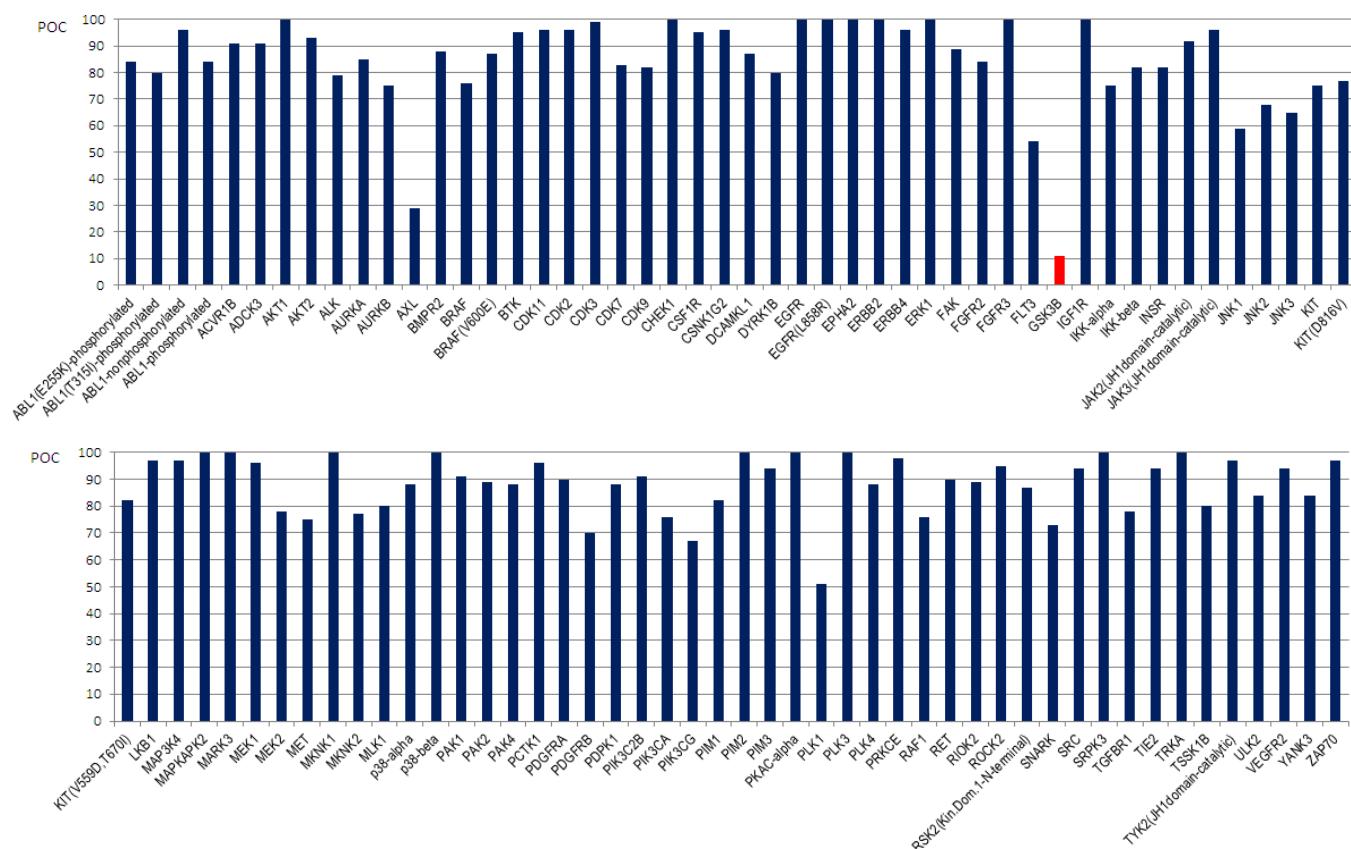

III. Experimental Procedures

General procedure for direct C–H/C–H cross-coupling of quinones with Arenes: (hetero)arene (0.1mmol), quinone (0.2 mmol), [Rh₂Cp*Cl₂]₂ (0.005 mmol), AgSbF₆ (0.02 mmol), and AgOAc (0.2 mmol) were combined in acetone (0.35 mL) in a cap test tube. The reaction mixture was heated to 60 °C. The reaction was stirred for 0.5~24 hours. The mixture was monitored by TLC using EtOAc and *n*-hexane = 1 : 3 as the mobile phase and stirred until starting material disappeared. After cooled to RT, the mixture solvent was removed under reduced pressure. The

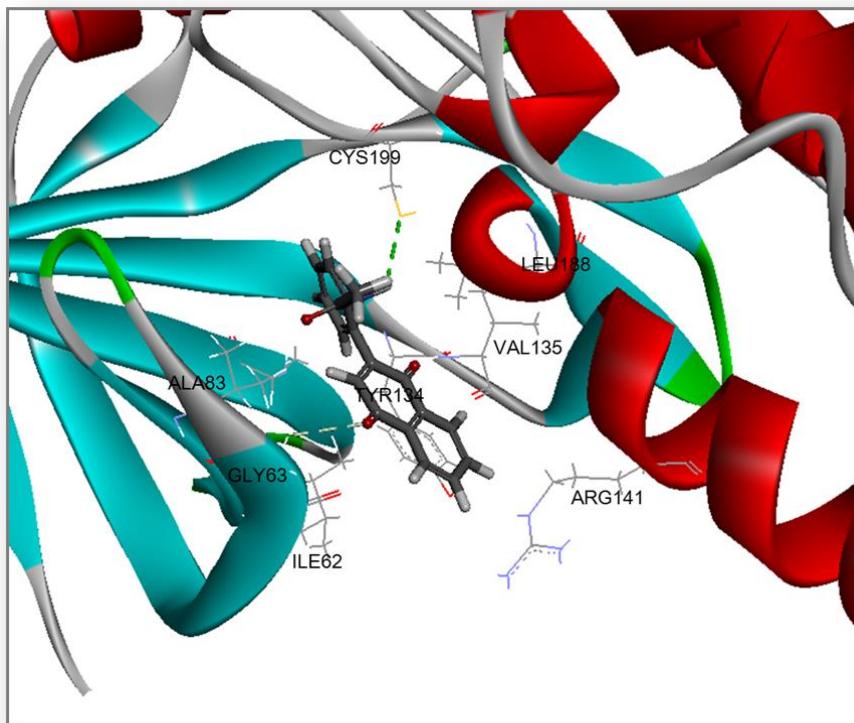

reaction mixture was diluted with CH₂Cl₂ and the residue was extracted with aqueous NH₄Cl (3 × 30 ml). The organic layer was dried over MgSO₄. After removal of solvent, the residue was purified by flash chromatography on silica gel to give desired product.

General procedure for base-mediated cyclization: anilide-substituted naphthoquinone (0.05 mmol), and 60% NaH (0.07 mmol) were combined in anhydrous DMSO (1.0 mL) under nitrogen condition. The reaction was stirred at 0 °C to room temperature for 10~12 h. The mixture was monitored by TLC using EtOAc and *n*-hexane = 1 : 1 as the mobile phase and stirred until starting material disappeared. The mixture solvent was removed under reduced pressure. The reaction mixture was diluted with EtOAc and the residue was extracted with aqueous NH₄Cl (3 × 30 ml). The organic layer was dried over MgSO₄. After removal of solvent, the residue was purified by flash chromatography on silica gel to give desired product.

Kinase Assay. The effects of compounds on the kinase activity of GSK3 β were analyzed by Reaction Biology Corp. (Malvern, PA, USA) using radiometric kinase assays ($[\gamma^{33}\text{P}]\text{-ATP}$). Briefly, reactions contained peptide substrate (YRRAAVPPSPSLSRHSSPHQ(pS)EDEEE) in freshly prepared Base Reaction Buffer (20 mM HEPES (pH 7.5), 10 mM MgCl₂, 1 mM EGTA, 0.02% BRIJ-35, 0.02 mg/ml BSA, 0.1 mM Na₃VO₄, 2 mM DTT, 1% DMSO). IKK were delivered into the substrate solution and gently mixed. The compounds in DMSO with indicated concentrations were then delivered to the reaction. Then, ^{33}P -ATP (specific activity 10 Ci/l) was added to initiate the reaction, and the mixture was further incubated for 2 h at room temperature. Reactions are spotted onto P81 ion exchange paper (Whatman # 3698-915). The filters were washed extensively in 0.75% phosphoric acid. Compounds were tested in a 10-dose IC₅₀ mode with 3-fold serial dilutions starting at 1 μM .
