#### Contents

Details of mass spectrometric analysis.

**Table S1.** Electronic-absorption properties of carotenoids isolated from *Rhodopseudomonas* sp. Rits.

**Table S2.** The  $^1\text{H}$  vicinal coupling constants for 3,4-didehydrorhodopin in  $\text{CDCl}_3$ .

**Figure S1.** Electronic-absorption spectra of each carotenoid found in *Rhodopseudomonas* sp. Rits obtained by on-line PDA.

**Figure S2.** A representative  $^1\text{H}$ -NMR spectrum of the isolated 3,4-didehydrorhodopin in  $\text{CDCl}_3$ .

### **Identification of Cars found in *Rhodopseudomonas* sp. Rits by mass spectrometry**

Table 1 lists the results of mass spectrometry of Cars #1 - #7. The molecular-ion peaks and their fragment peaks originating from the cleavage of terminal groups can be used to identify each Car. More specifically, the fragment peaks at  $[\text{MH}-18]^+$ ,  $[\text{MH}-32]^+$ ,  $[\text{MH}-50]^+$  and  $[\text{MH}-64]^+$  correspond to the cleavage of terminal hydroxy, methoxy, hydroxy-methoxy and two methoxy groups in the molecule. Car #1 possessing  $(\text{C}=\text{C})_{11}$  group exhibits the molecular-ion peak at 537.4 as the protonated form and no detectable fragment peak under present MS conditions. Car #2 possessing  $(\text{C}=\text{C})_{12}$  group exhibits the molecular-ion peak at 567.4 ( $[\text{MH}]^+$ ) and the sole fragment peak at 535.4 ( $[\text{MH}-32]^+$ ). This fragment peak is assigned to the cleavage of a terminal methoxy group in the molecule. Car #3 possessing  $(\text{C}=\text{C})_{13}$  group exhibits the molecular-ion peak at 597.3 ( $[\text{MH}]^+$ ) and two fragment peaks at 565.4 ( $[\text{MH}-32]^+$ ) and 533.3 ( $[\text{MH}-64]^+$ ). These fragment peaks are assigned to the removal of one and two terminal methoxy groups in the molecule. Car #4 possessing  $(\text{C}=\text{C})_{11}$  group and Car #5 possessing  $(\text{C}=\text{C})_{12}$  group exhibit the molecular-ion peaks at 555.3 and 553.3 ( $[\text{MH}]^+$ ) and the sole fragment peaks at 537.4 ( $[\text{MH}-18]^+$ ) and 535.3 ( $[\text{MH}-18]^+$ ), respectively. These fragment peaks are assigned to the cleavage of a terminal hydroxy group in the molecule. Car #6 possessing  $(\text{C}=\text{C})_{12}$  group and Car #7 possessing  $(\text{C}=\text{C})_{13}$  group exhibit the molecular-ion peaks at 585.4 and 583.3 ( $[\text{MH}]^+$ ), respectively, and the three fragment peaks at 567.1 ( $[\text{MH}-18]^+$ ), 553.4 ( $[\text{MH}-32]^+$ ) and 535.3 ( $[\text{MH}-50]^+$ ) for Car #6 and 565.2 ( $[\text{MH}-18]^+$ ), 551.3 ( $[\text{MH}-32]^+$ ) and 533.2 ( $[\text{MH}-50]^+$ ) for Car #7. These fragment peaks are assigned to the cleavage of a terminal hydroxy, a methoxy and hydroxy-methoxy groups in the molecule.

Table S1. Electronic-absorption properties of carotenoids isolated from the cells of *Rhodopseudomonas* sp. Rits.

Peak # in HPLC	Carotenoid (number of conjugated double bonds)	$\lambda_{\max}$ in the eluent (nm)			$\epsilon$ at $\lambda_{\max}$ in the literature <sup>a</sup> ( $M^{-1}\cdot cm^{-1}$ )	$\epsilon$ at 450 nm in the eluent ( $M^{-1}\cdot cm^{-1}$ )
		0 $\rightarrow$ 2	0 $\rightarrow$ 1	0 $\rightarrow$ 0		
1	Lycopene (11)	445	484	504	184,900 <sup>b</sup>	119,700
2	Anhydrorhodovibrin (12)	458	484	516	152,800 <sup>b</sup>	96,600
3	Spirilloxanthin (13)	467	494	528	147,200 <sup>c</sup>	68,600
4	Rhodopin (11)	445	472	504	165,600 <sup>c</sup>	106,600
5	3,4-Didehydrorhodopin (12)	458	484	516	–	96,600
6	Rhodovibrin (12)	458	484	516	–	96,600
7	OH-Spirilloxanthin (13)	467	494	528	–	68,600

<sup>a</sup>Data taken from Britton (Ref.15). <sup>b</sup>In petroleum ether. <sup>c</sup>In benzene.

Table S2. The  $^1\text{H}$  vicinal coupling constants<sup>a</sup> (Hz) for 3,4-didehydrorhodopin in  $\text{CDCl}_3$ .

C3H=C4H	16	C6H-C7H	11
C7H=C8H	15	C10H-C11H	11
C11H=C12H	16	C14H-C15H	11
C11'H=C12'H	16	C14'H-C15'H	11
C7'H=C8'H	16	C10'H-C11'H	12
		C6'H-C7'H	11

<sup>a</sup>15H=15'H coupling constant was not determined due to the contribution of long-range coupling via 14H (14'H).

Figure S1. Electronic-absorption spectra of each Car found in *Rhodospseudomonas* sp. Rits obtained by on-line PDA. Numbers in the figure correspond to the HPLC elution order shown in Figure 1.

Figure S2. A representative <sup>1</sup>H-NMR spectrum of the isolated 3,4-didehydrorhodopin in CDCl<sub>3</sub> at room temperature.
