Compositions of Solutions for Copolymerization Experiments.

The water solubility of N-acryloylglyphosate (AA) was found to be between 0.5 and 0.6 g in one mL of water; however, AA can be swelled by water as well as by water-soluble acrylate monomers such as hydroxyethyl acrylate (HEA) and dimethylaminoethyl acrylate (DMA). A water/AA mixture was prepared that was only 42% water by weight, though the AA was not fully dissolved. Water was also needed for dissolution of AA with HEA and DMA, as detailed in Table 1:

Table S1. Concentrations of AA achieved in mixtures with water, HEA.

Mass of AA, g	Mass of HEA, g	Mass of Water, g	Composition by Mass
1.027		0.75	58% AA, 42% water
0.803	0.428	1.00	40% AA, 22% HEA, 38% water
