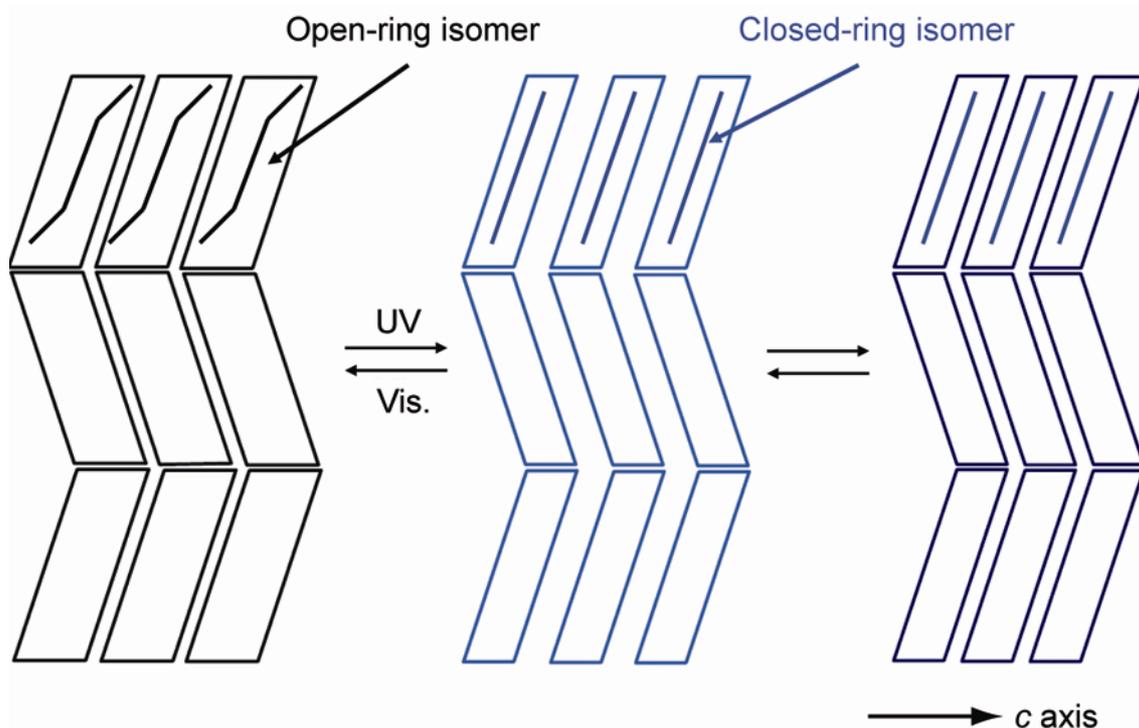

Fig. S1 Schematic illustration of photocontraction of a crystal viewed from (010) face. Upon irradiation with UV light the open-ring isomers (black line) converted to the closed-ring isomers (blue line). The thickness of the molecules is reduced as the molecules convert from the open- to the closed-ring isomers. The thin-shaped closed-ring isomers were stacked one by one. The molecular stacking resulted in the macroscopic contraction of the crystal along the *c* axis.
