

Supplementary Information for

“Protein profiles of *Escherichia coli* and *Staphylococcus warneri* are altered by photosensitization with cationic porphyrins”

Eliaana Alves,^a Ana Cristina Esteves,^a António Correia,^a Ângela Cunha,^a Maria A. F. Faustino,^b Maria G. P. M. S. Neves^b and Adelaide Almeida^{*a}

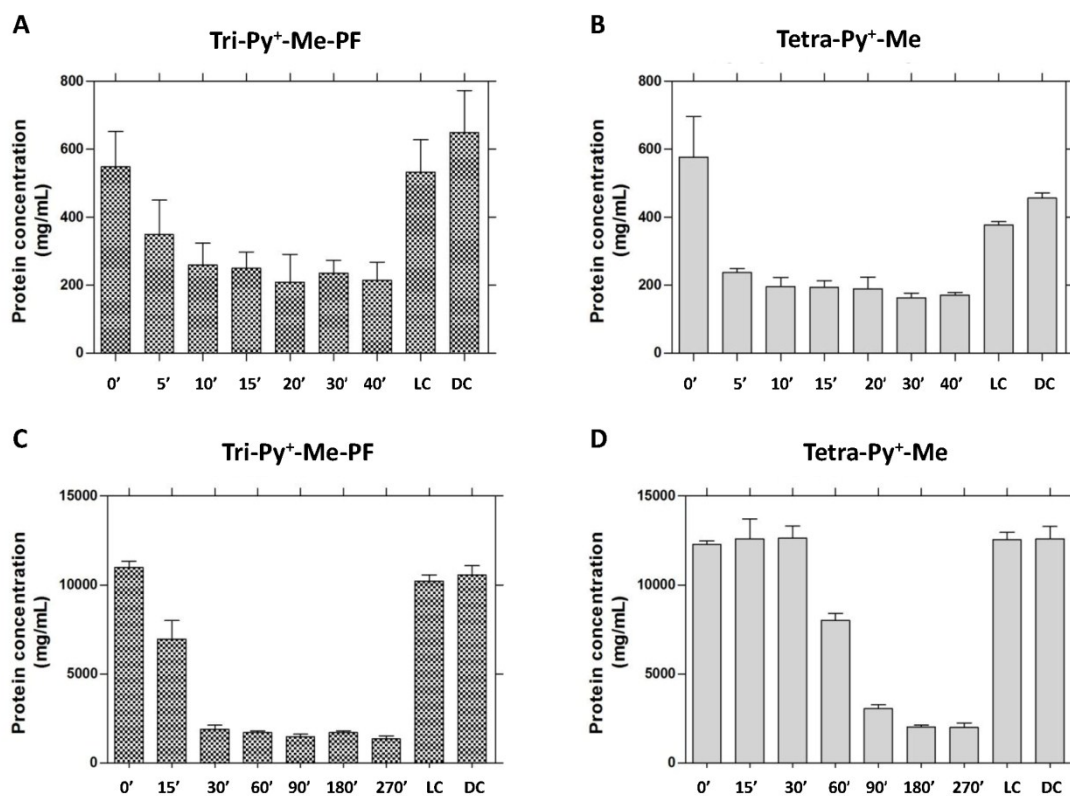

Figure S1. Concentration of protein (in mg per mL) in each sample of bacteria photosensitized with both porphyrins after the different irradiation times (0'-40' for *S. warneri* and 0'-270' for *E. coli*) determined by the bicinchoninic acid protein assay (BCA). **A)** *S. warneri* photosensitized with Tri-Py⁺-Me-PF; **B)** *S. warneri* photosensitized with Tetra-Py⁺-Me; **C)** *E. coli* photosensitized with Tri-Py⁺-Me-PF; **D)** *E. coli* photosensitized with Tetra-Py⁺-Me. LC: light control; DC: dark control.
