Azodiisobutyonitrile (AIBN) was recrystallized from methanol. Tetrahydrofuran (THF), methyl acylate (MA), styrene (St) and chloroform was distilled following the standard procedures. Other solvents and reagents, unless stated specifically, were purchased from Beijing Chemical Reagent Co. and used as received.
${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data were collected on Bruker 400 MHz spectrometers operated at room temperature with $\mathrm{CDCl}_{3}$ as the solvent. Chemical shifts ( $\delta$ ) are reported in ppm with $\left(\mathrm{CH}_{3}\right)_{4} \mathrm{Si}$ and the residual solvent peak as the reference, respectively. UVVis spectra were recorded on the Perkin-Elmer Instruments Lambda spectrometer. High resolution mass spectra (HRMS) were measured by Bruker APEX IV Fourier Transform Ion Cyclotron Resonance Mass Spectrometer. Molecular weight and PDI were measured by a gel permeation chromatograph (GPC) equipped with a Waters 410 refractive-index detector, a Waters 515 HPLC pump, and HT1, 2, 4 columns with THF as an eluent at a flow rate of $1.0 \mathrm{~mL} / \mathrm{min}$ at $35^{\circ} \mathrm{C}$. Monodispersity polystyrene standards were used for calibration.

## General Sonication Conditions.

The sonication experiments were performed using a JY96-II Ultrasonic Cell Crusher Instrument (Ningbo Scientz Biotechnology Co. LTD) operating at 20 kHz equipped with 6 mm tip titanium probe. The whole system was immersed in an icesalt bath and pulsed ultrasound was applied ( 1.0 s on and 1.0 s off) at 300 W for 3 h for each experiment.

## 14. Theoretical Calculation

The activation energy of the chain scission was calculated based on the Extended Bell Theory (EBT). ${ }^{[52]}$ The EBT calculations were conducted with the Gaussian package using density functional theory, employing the $6-31 \mathrm{G}^{*}$ basis set and the B3LYP exchange-correlation energy functional. An analogue of RAFT-HDA adducts with a benzyl ring and a pyridine unit in the structure was employed as a model for simplifying the calculation process. Figure S12 and S13 showed the optimized structures of the model molecule and its transition state. Table S1 demonstrated the $\Delta \mathrm{R}(\Delta \mathrm{R}$ refers to the change in the mechanical pulling coordinate) and $\Delta \chi$ ( $\Delta \chi$ refers to the change in the compliances of the reactant state and transition state in the pulling along R) for the atom pair in all the possible pulling points for RAFT-HDA mechanophore, which was calculated from the molecules's ( $3 N \times 3 N$ ) Hessians in the RAFT-HDA adduct and TS configurations. The possible situations were summarized in Figure S14. From Table S1, we can get the values of $\Delta \mathrm{R}$ and $\Delta \chi$, and applied them in the equation: $\mathrm{E}=\mathrm{E}_{0}-\mathrm{F} \Delta \mathrm{R}-\mathrm{F}^{2} \Delta \chi / 2$ to obtain the change in activation energy in the cycloreversion of DA adduct.
