## General methods

Molecular sieves were activated at $180^{\circ} \mathrm{C}$ under diminished pressure for 2 h . DCM and all amines were purified and dried by distillation from $\mathrm{CaH}_{2}$ immediately before the experiment. All solvents for a column chromatography were distilled before using. Thin layer chromatography was performed using pre-coated aluminum plates (Kieselgel $60 \mathrm{~F}_{254}$, Merck), which were visualized with the phosphomolybdic acid - ceric sulfate reagent. Flash column chromatography (FC) was performed on Kieselgel $60\left(40-63 \mu \mathrm{~m}\right.$, Merck). ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded at $24^{\circ} \mathrm{C}$ in Bruker DPX-300, and Bruker Avance-600 spectrometers in $\mathrm{CDCl}_{3}$ as a solvent unless otherwise stated. The signals of $\mathrm{SiMe}_{4}(\delta=0.00 \mathrm{ppm})$ and $\mathrm{CDCl}_{3}(\delta=77.16 \mathrm{ppm})$ were used as internal references. $J$ values are given in Hz. Signals were assigned by 2D proton-proton (COSY) shift correlation spectra. Mass spectra were recorded in a Bruker Ultraflex time-of-flight mass spectrometer using 2,5-dihydroxybenzoic acid as a matrix.

## Lectin-induced agglutination of galactosylated liposomes

Cationic liposomes ( $100 \mu \mathrm{~L}, 1 \mathrm{mM}$ of phospholipid) were diluted in 1.8 ml of 150 mM NaCl followed by incubation with $100 \mu \mathrm{~L}$ of $\mathrm{RCA}_{120}(1 \mathrm{mg} / \mathrm{mL})$. After rapid mixing the agglutination of the liposomes was estimated at room temperature by the time dependent increase in turbidity, as measured by the absorbance at 450 nm with Helios Alpha spectrometer (Thermo Spectronic).
