

Supplementary Information for
Convenient synthesis of s-triazine based urea derivatives via palladium
catalyzed C-N coupling reaction

1. Experimental	2-8
2. ¹H and ¹³C NMR Spectra.....	9-21

1. Experimental

1.1 Reagents

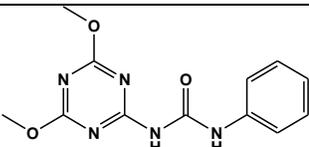

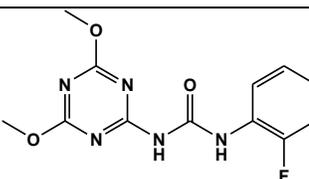

All reactions were carried out under a nitrogen atmosphere. Air- and moisture-sensitive solvents and solutions were transferred via syringe or stainless steel cannula. All chemicals were purchased from sigma Aldrich, merck and fluka. Solvents used were of analytical grade. Anhydrous cesium carbonate was stored in a nitrogen-filled glovebox, ground and was taken out in small quantities and stored in a desiccator. Aryl ureas (1a-13a) were prepared by known methods¹. 1a², 1b³, 1c^{2, 3}, 1d^{2, 4} and 1e were synthesized using literature procedures. All reactions were routinely checked by TLC. TLC was performed on aluminum-backed silica gel plates (silica gel 60 F₂₅₄ grade, Merck DC) with spots visualized by UV light. Column chromatography was performed on silica gel LC 60A (70-200 micron).

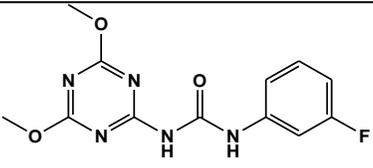

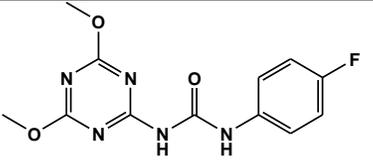

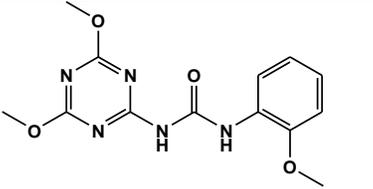

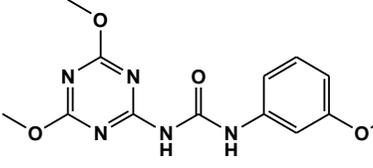

1.2 Instrumental

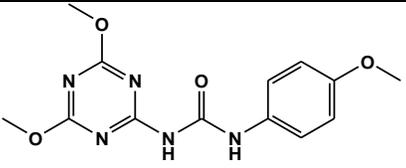

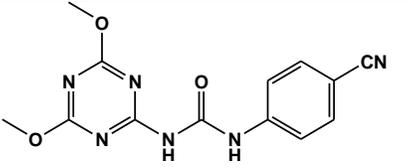

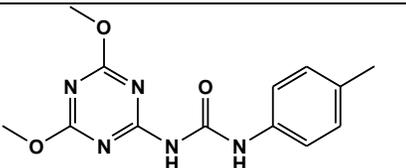

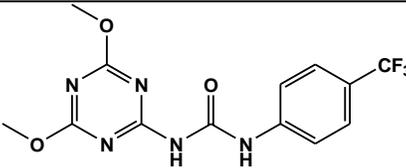

All compounds were characterized by ¹H NMR, ¹³C NMR as well as elemental analysis. Melting points were determined in open capillaries on a Veego electronic apparatus VMP-D (Veego Instrument Corporation, Mumbai, India) and are uncorrected. ¹H NMR and ¹³C NMR spectra were recorded on a Bruker 400 MHz model spectrometer using DMSO-*d*₆ as a solvent and TMS as internal standard with ¹H resonant frequency of 400 MHz and ¹³C resonant frequency of 100 MHz. The ¹H NMR, ¹³C NMR chemical shifts were reported as parts per million (ppm) downfield from TMS (Me₄Si). The splitting patterns are designated as follows; s, singlet; d, doublet; t, triplet; m, multiplet. Elemental analyses (C, H, N) were performed using a Heraeus Carlo Erba 1180 CHN analyzer (Hanau, Germany).

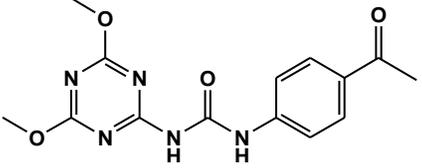

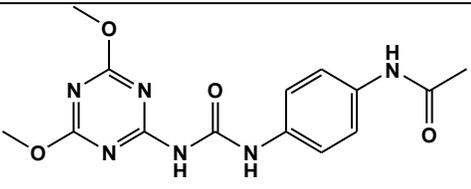

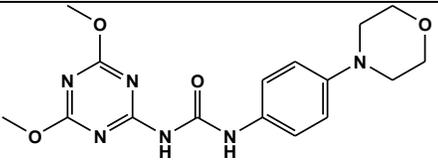

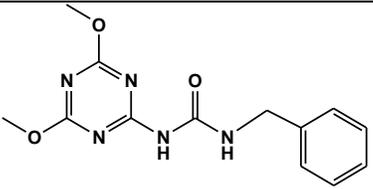

2. General procedure for Pd-catalyzed couplings of 2-Chloro-4,6-disubstituted-s-triazine with various ureas:

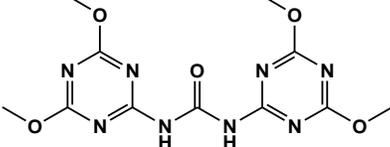

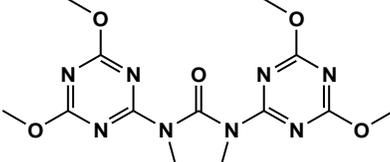

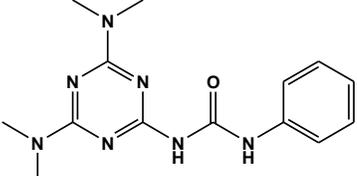

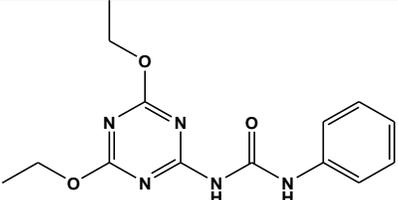

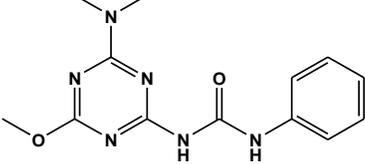

To an oven dried flat-bottomed flask which was equipped with a magnetic stir bar, was charged with ureas (1.0mmol), Cs₂CO₃ (1.4 mmol), Xantphos (5 mol %), Pd₂(dba)₃ (3.3 mol %), and 2-chloro-4, 6-disubstituted-s-triazine (1.0mmol) in 1,4-dioxane (5.0 mL). The reaction was sparged with nitrogen for 15 minutes, stirred and heated to 100 °C for 10 hours. The reaction mixture was cooled to room temperature and filtered through a pad of Celite eluting with ethyl acetate. The filtrate was concentrated and purification of the residue by silica gel column chromatography gave the desired product 3a–3t. Yield: 45-96 %.
