Fig. S4. Fluorescence intensity at 424nm (F_{424}) of **BMD** (10 µM) versus increasing concentration of Log[Zn²⁺]. The fluorescence response fits to a Hill coefficient of 1.01281, which is consistent with the 1:1 binding stoichiometry for the **BMD**-Zn²⁺ complex.

Fig. S5. Linear dependence of intensity ratio ($F_{424 \text{ nm}}/F_{502 \text{ nm}}$) of probe **BMD** (10 µM) on the concentration of Zn²⁺ (1.0 to 4.25 µM) in CH₃CN/H₂O (2:8, v/v, HEPES 10 mM, pH = 7.4).

The detection limit is calculated with the equation: detection limit= $3s/\rho$, where s is the standard deviation of blank measurements, ρ is the slope between intensity ratio $(F_{424 \text{ nm}}/F_{502 \text{ nm}})$ versus Zn²⁺ concentration.

X-ray Crystallographic Details.

Diffraction intensities for BMD were collected using a Bruker APEX-II CCD diffractometer equipped with graphite-monochromated Mo-Ka radiation with radiation wavelength 0.71073 Å by using the $\varphi - \omega$ scan technique at 296(2) K. The structures were solved by the direct method and refined by the Full-matrix least-squares on F^2 using the SHELXL software.¹ Non-hydrogen atoms were refined with anisotropic temperature parameters. The hydrogen atoms of organic ligands were generated geometrically and refined isotropically. CCDC 919147 contain the supplementary crystallographic data in this paper. These data can be obtained free of charge The Crystallographic from Cambridge Data Centre via www.ccdc.cam.ac.uk/data request/cif.
