1. General experimental methods

Infrared (IR) spectra were recorded on a Bruker TENSOR TM 27 (IRFT), wave numbers are indicated in cm^{-1} . NMR spectra were recorded on a Bruker AVANCE 400. ^1H NMR were recorded at 400 MHz and data are reported as follows: chemical shift in ppm from tetramethylsilane as an internal standard with the residual solvent peak as an internal indicator (DMSO- d_6 δ : 2.50, CDCl_3 δ : 7.26, C_6D_6 δ : 7.16), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet or overlap of non-equivalent resonances, br = broad, app = apparent), integration. ^{13}C NMR spectra were recorded at 100 MHz and the data are reported as follows: chemical shift in ppm from tetramethylsilane as an internal standard with the residual solvent peak as an internal indicator (DMSO- d_6 δ : 39.5 ppm, CDCl_3 δ : 77.2 ppm, C_6D_6 δ : 128.1 ppm), multiplicity with respect to proton (deduced from DEPT experiments, s = quaternary C, d = CH, t = CH_2 , q = CH_3). 1,4-Dioxane was distilled over CaH_2 prior to distillation, and stored over 4\AA molecular sieves. TLC was performed on silica gel plates visualized either with a UV lamp (254 nm), or using solution of *p*-anisaldehyde-sulfuric acid-acetic acid in EtOH followed by heating. Purification was performed on silica gel (Merck-Kieselgel 60, 230-400 mesh). Mw spectra with electronic impact (MS-EI) were recorded on a GC/MS (70 eV). HRMS were performed at the Laboratoire de Spectrométrie de Mwe SM³E de l'Université Pierre et Marie Curie de Paris).

2. General procedure for the copper-catalyzed amidation

In a sealed tube, to a solution of amide (1.5 equiv), CuI (5 mol %) and K_2CO_3 (2 equiv) in 1,4-dioxane (1 M), was added the chloro-heterocycle (1.0 equiv) and *trans*-*N,N*-dimethylcyclohexane-1,2-diamine (5 mol %). The tube was degassed by three vacuum/argon cycles and sealed. The reaction mixture was heated at 170 °C for 24 h, and directly purified by silica-gel chromatography.
