S13-S49	^1H and ^{13}C NMR Spectra

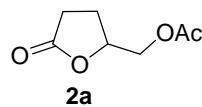

(A) Materials and Methods

Infrared spectra were recorded on a BIO-RAD FTS 165 FT-IR spectrophotometer and reported in wave numbers (cm^{-1}). ^1H NMR and ^{13}C NMR spectra were obtained in CDCl_3 solutions with a Brucker DPX 500 spectrophotometer at 500 MHz and 125 MHz, respectively. NMR spectra are referenced to residual chloroform (δ 7.26 ppm, 1H; δ 77.0 ppm, 13 C). Chemical shifts are reported in ppm (δ); mutiplicities are indicated by s (singlet), d (doublet), t (triplet), q (quartet), quin (quintet) and m (multiplet). Coupling constants, J, are reported in Hertz. Low resolution mass spectra were obtained on a Finnigan/MAT LCQ spectrometer in ESI mode. High resolution mass spectra were obtained on a Finnigan/MAT 95XL-T spectrometer. Enantiomeric excesses were determined by HPLC analysis on Shimadzu HPLC units, including the following instruments: pump, LC-20AD; detector, SPD-20A; column, Daicel Chiraldak IB. Thin-layer chromatography (TLC) was performed on Merck aluminum-precoated plates of silica gel 60 F₂₅₄. Visualization was obtained by spraying with basic potassium permanganate with subsequent heating. Column chromatography was performed with silica gel 60 (230-400) mesh. The *tert*-butyl hydroperoxide (TBHP) 5-6 M solution in decane was purchased from Aldrich Chemical Co. Commercially available reagents and solvents were used without further treatment.

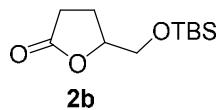

(B) DIB/TBHP oxidation of heterocycles

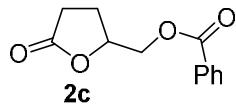

Representative procedure for the oxidation of heterocycle: To a solution of (tetrahydrofuran-2-yl)methyl acetate (**1a**) (72 mg, 0.50 mmol) in nitromethane (1 mL) was added diacetoxyiodobenzene (484 mg, 1.5 mmol) at 0 °C. The resultant suspension was vigorously stirred and a solution of *tert*-butylhydroperoxide (5.0 M in decane, 400 μL, 2.0 mmol) was added dropwise over 30 min. After 12 hours, the reaction was quenched with Na₂SO₃ (5 mL). The organic layer was separated and the aqueous layer was extracted with dichloromethane (4 x 5 mL). The combined extracts were dried (MgSO₄), filtered, and concentrated *in vacuo*. The residue was purified by flash column chromatography eluted with *n*-hexanes/EtOAc (2:1) to yield (5-oxotetrahydrofuran-2-yl)methyl acetate (**2a**) as a yellow oil (51 mg, 65%).
