## Supporting Information

**General:** The NMR spectra were recorded on a Bruker Avance II+ 600 spectrometer (Rheinstetten, Germany) at 25°C; the chemical shifts were quoted in ppm in  $\delta$ -values against tetramethylsilane (TMS) as an internal standard and the coupling constants were calculated in Hz. The assignment of the signals was confirmed by applying 2D techniques. The spectra were recorded as  $10^{-1}$  M solutions in deuteriochloroform except NOESY experiments where  $3 \times 10^{-2}$  M solutions were used in order to avoid transmolecular interactions. The spectra were processed with Topspin 2.1 program.
