Figure S1. The bond lengths for the S ₀ and T ₁ states for the main fragment of the compound 1	p.2
Figure S2. MOs diagram for compound 1	p.3
Figure S3. MOs diagram for compound 2	p.4
Figure S4. MOs diagram for compound 3	p.4
Figure S5. MOs diagram for compound 4	p.5
Figure S6. MOs diagram for compound 5	p.6
Figure S7. NICS(0) and NICS(1) calculations for compound 1 ²⁻ and 1 ²⁺	p.7
Figure S8. The Ullman-type polymerization as the possible route to synthesize the TOC-based sheets	p.8
Table S1. S ₀ →S ₁ and S ₀ →T ₁ electronic transitions for the compounds 1–5	p.9
Table S2. S ₀ →S ₁ and S ₀ →T ₁ electronic transitions for the 1D ribbons	p.12
Table S3. Total energy for compounds 1–5	p.15
Optimized Cartesian coordinates of compounds 1–5 (Tables S4–S13)	p.16

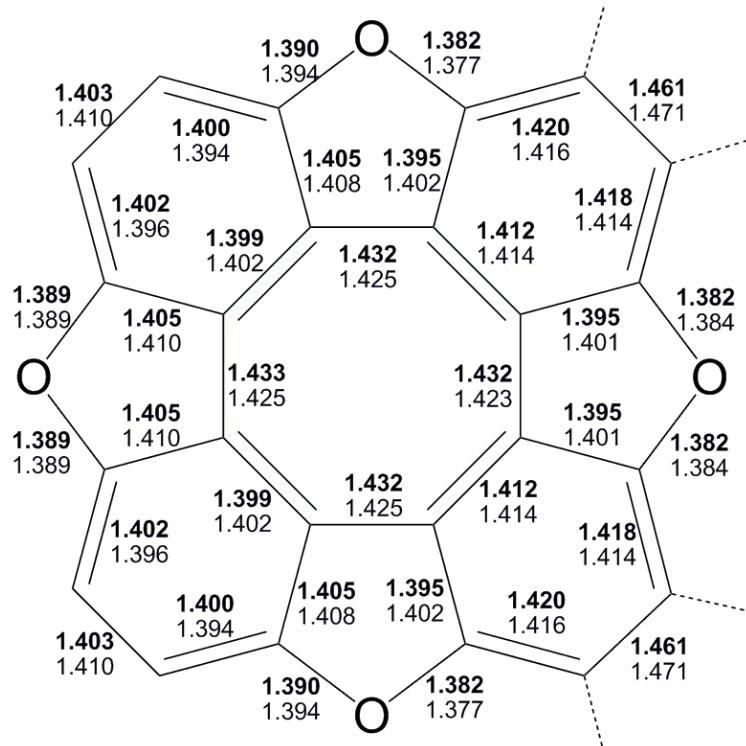

Figure S1. The bond lengths for the S_0 (in bold) and T_1 states (top) for the main fragment of the compound **1** calculated at the B3LYP/6-21G(d) theory level.*

* The 6-21G(d) double-valence split basis set affords us to optimize all studied systems which consist at the most of 432 atoms (compounds **4** and **5**). The extension of the chosen basis set prevents optimization of all studied molecules at the uniform level of accuracy. For comparison we have optimized the sheet **1** with the 6-31G(d) basis set. The calculated deviations in the structural parameters are negligible (no more than 0.004 Å for the bond lengths) and all conclusions remain. Thus, the choice of the 6-21G(d) basis set is quite justified by a very big size of the studied systems.

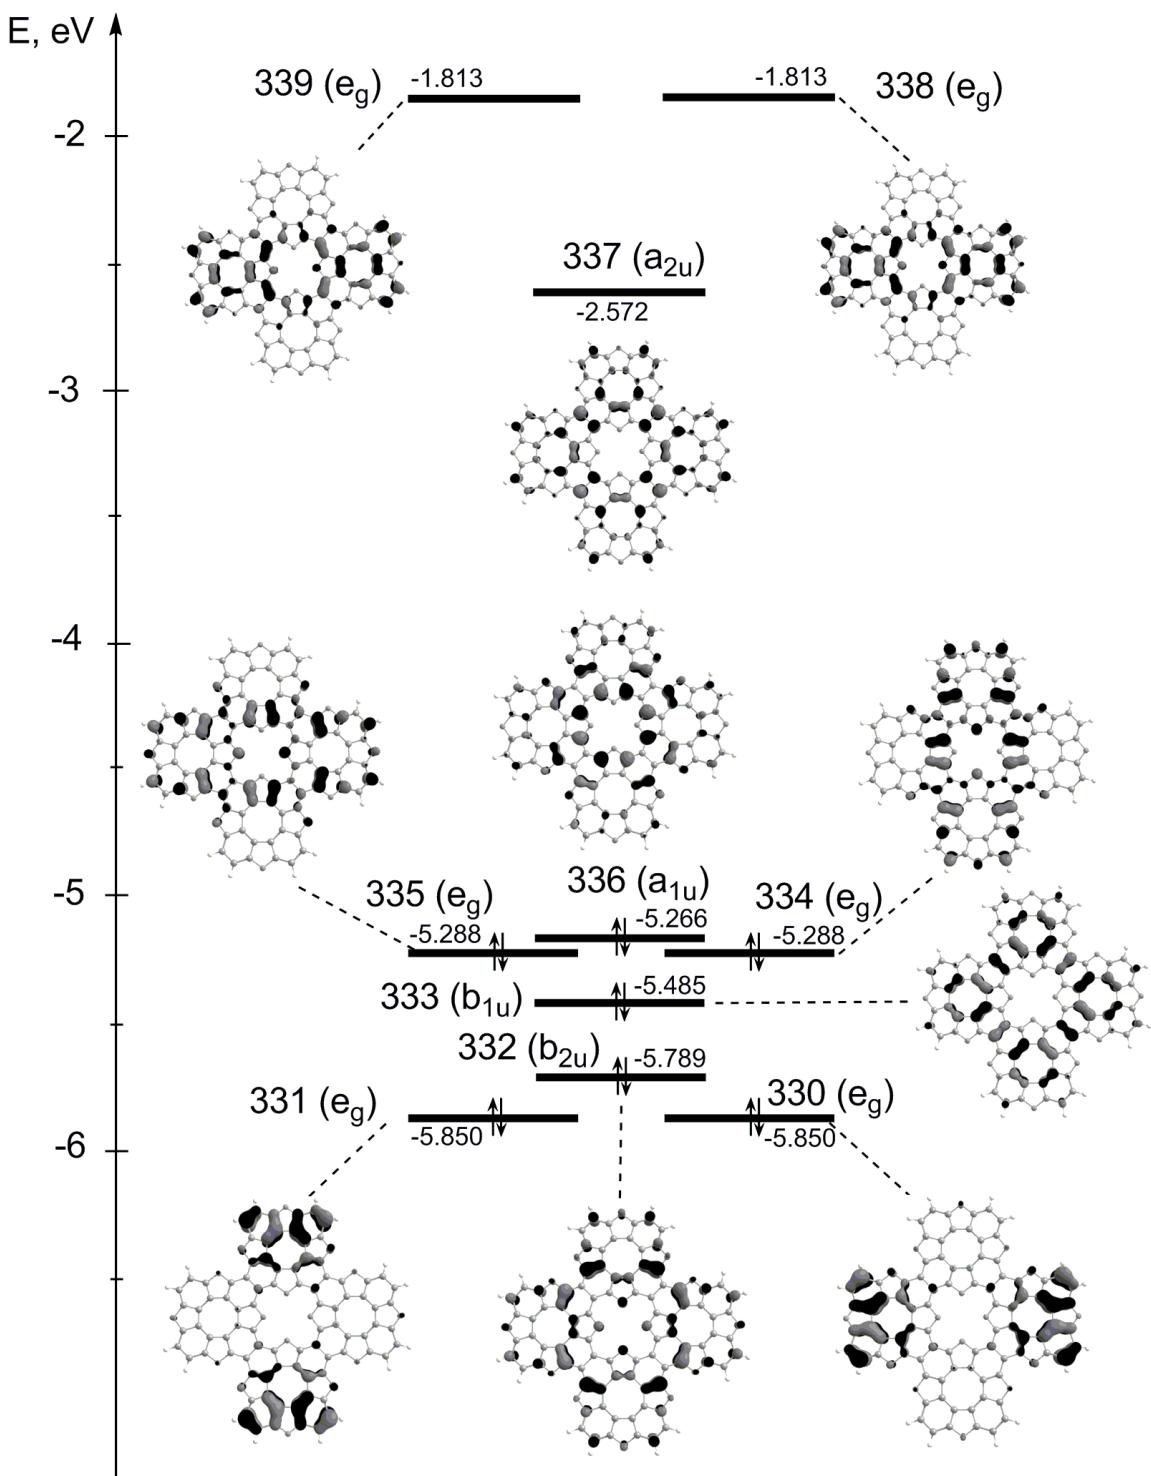

Figure S2. Molecular orbital diagram of the compound **1** calculated at the B3LYP/6-21G(d) level of theory. The highest occupied and lowest empty MO are numerated and their symmetry in the D_{4h} point group are given in parenthesis.

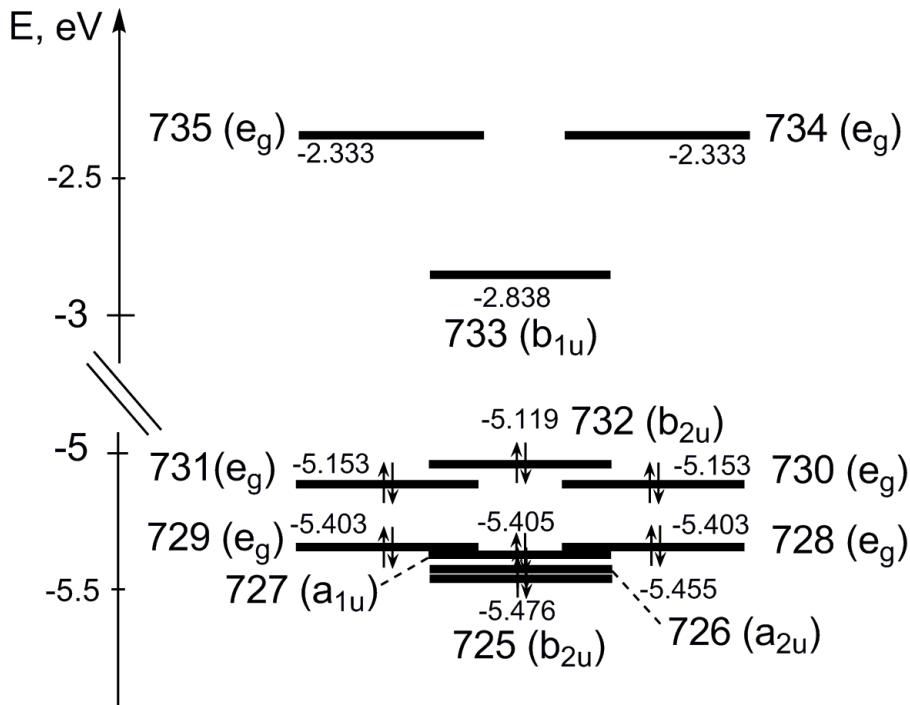

Figure S3. Molecular orbital energy diagram of the compound **2** calculated at the B3LYP/6-21G(d) level of theory

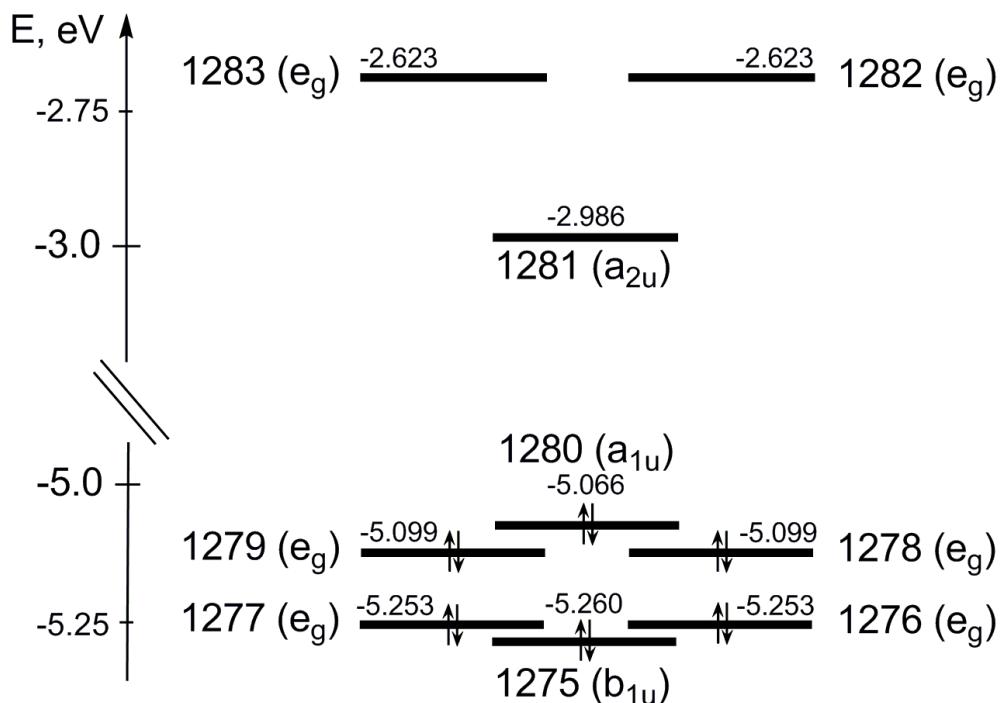

Figure S4. Molecular orbital energy diagram of the compound **3** calculated at the B3LYP/6-21G(d) level of theory

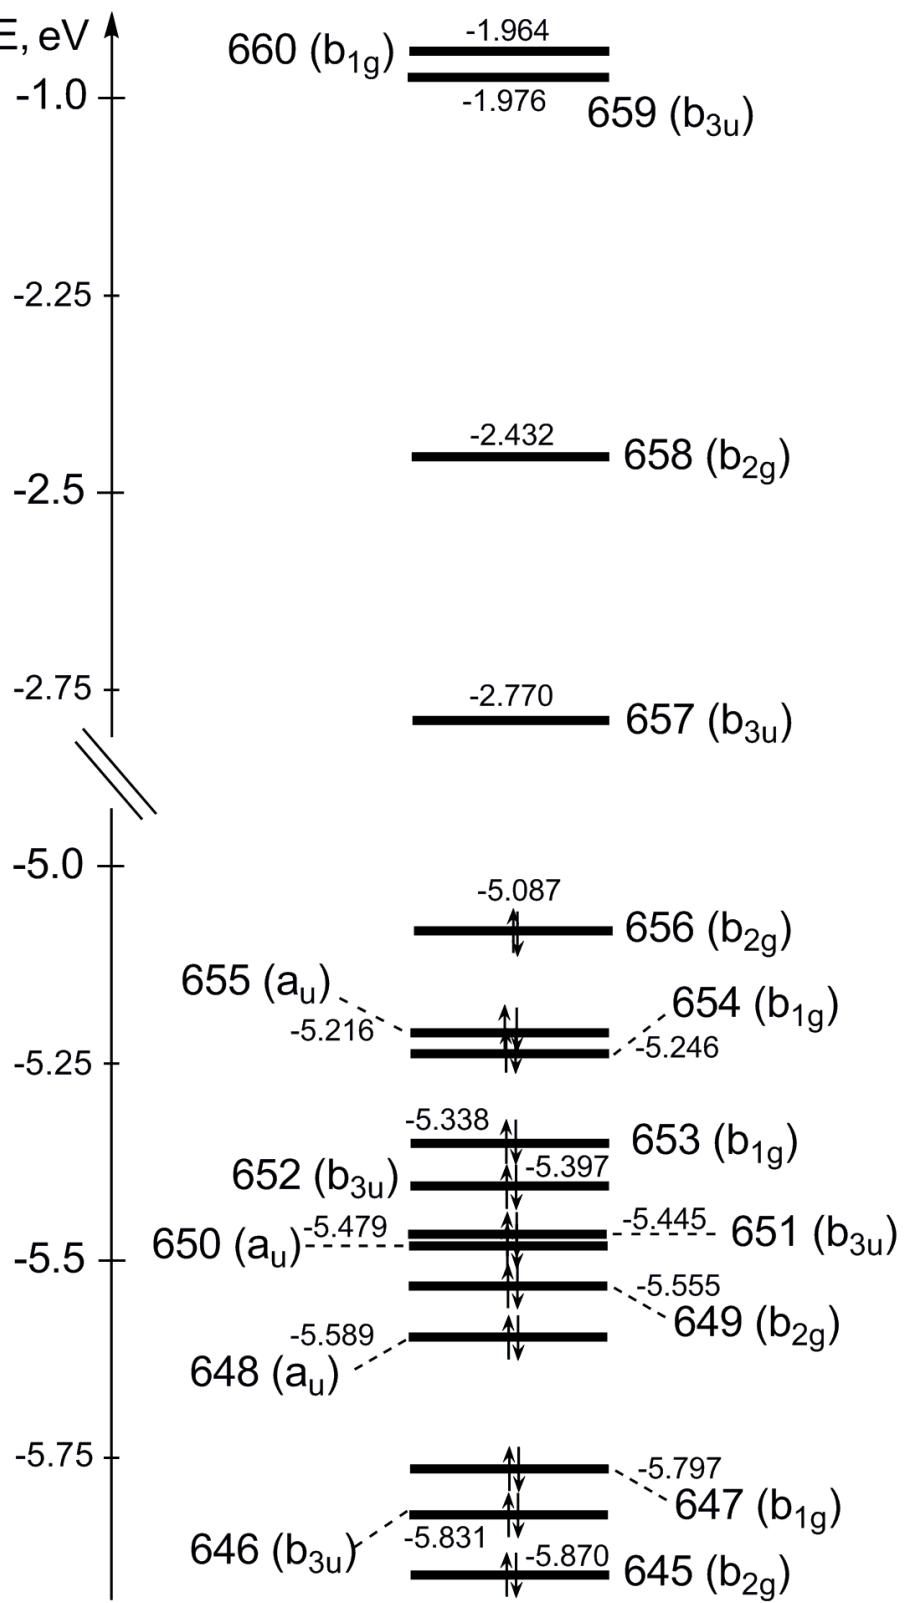

Figure S5. Molecular orbital energy diagram of the compound **4** calculated at the B3LYP/6-21G(d) level of theory

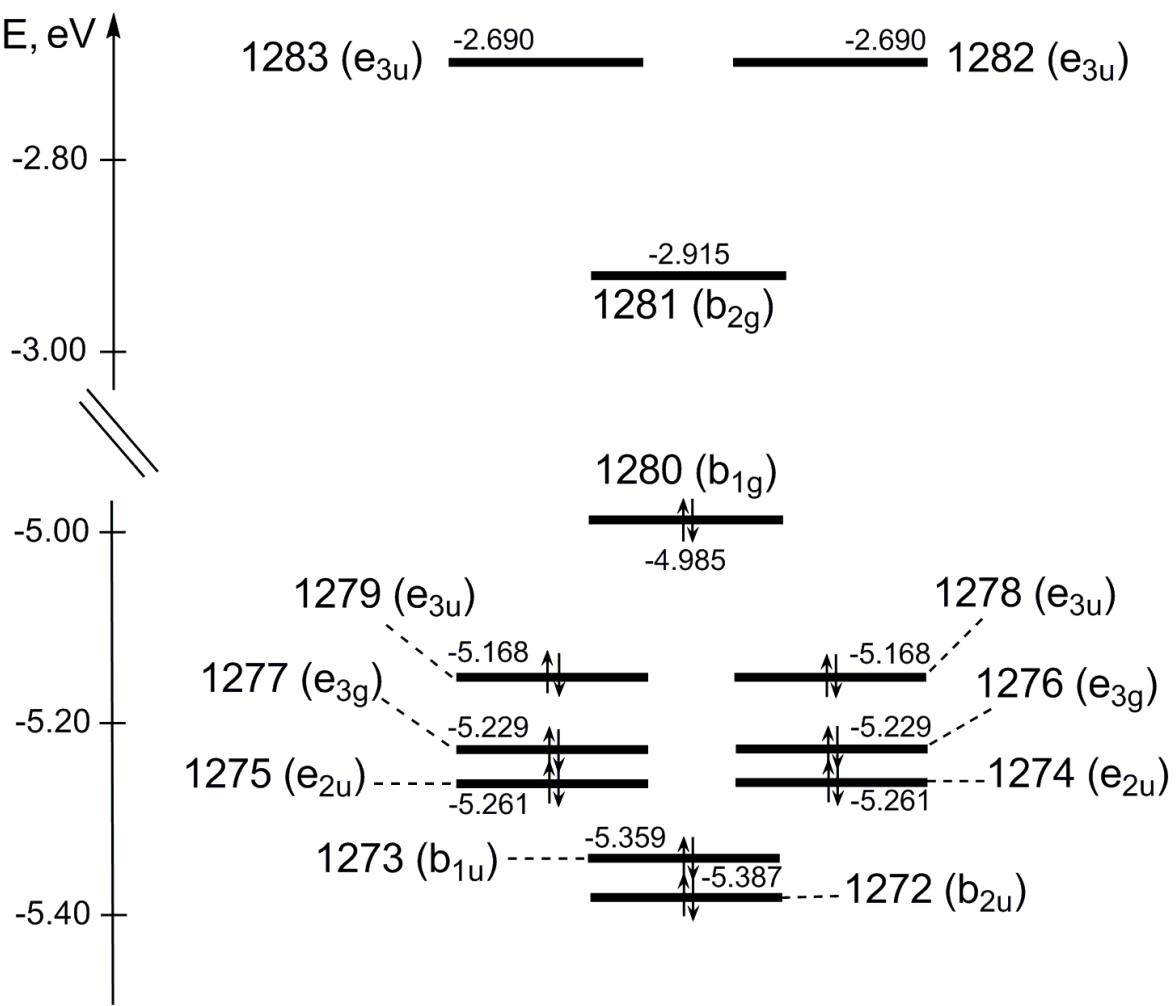

Figure S6. Molecular orbital energy diagram of the compound **5** calculated at the B3LYP/6-21G(d) level of theory

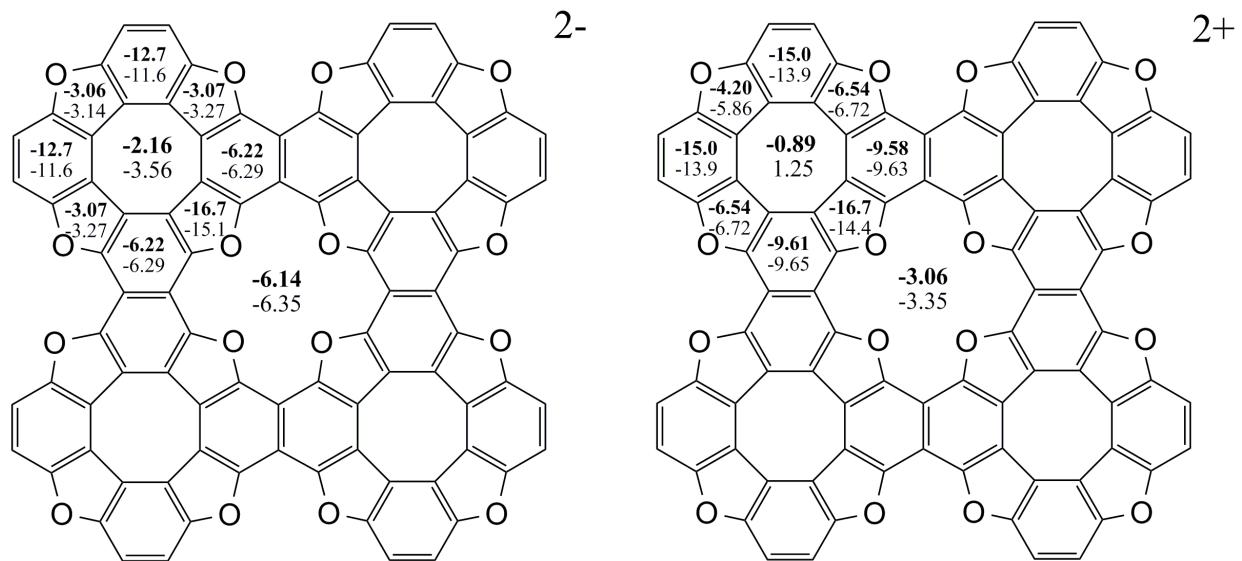

Figure S7. The NICS(0) (bold type in top) and NICS (1) (bottom) indexes calculated at the GIAO B3LYP/6-311++G(d,p) level of theory for the dicationic and dianionic forms of the compound **1**.

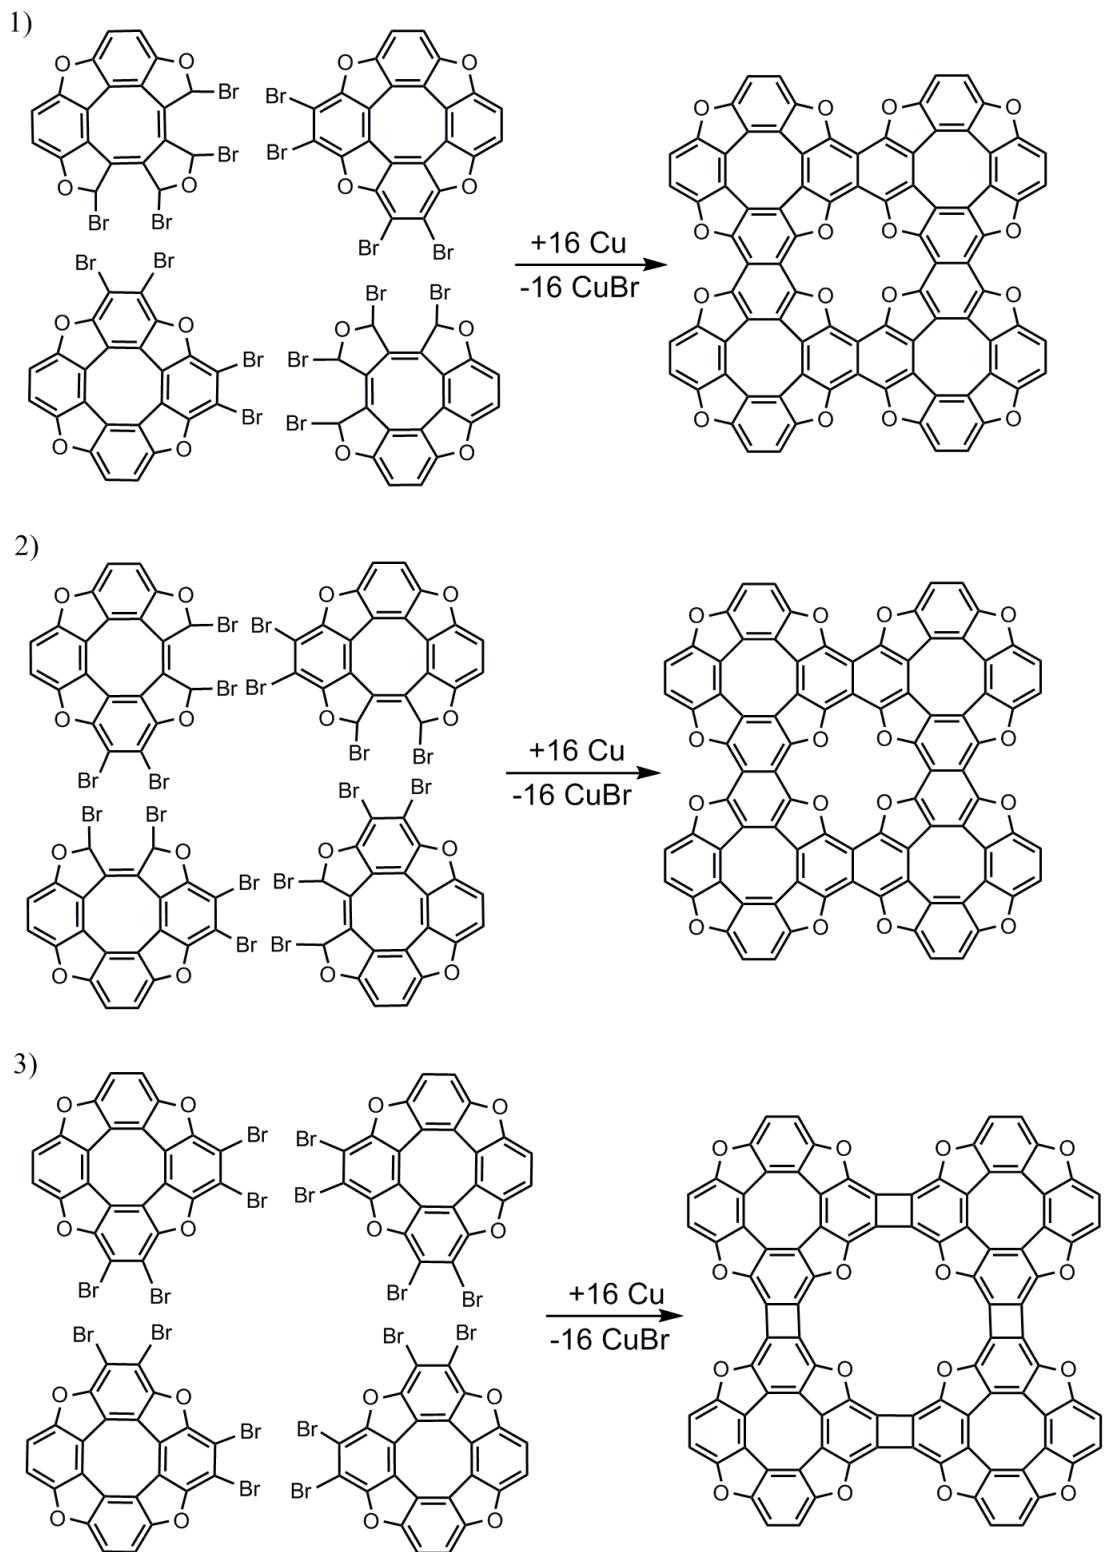

Figure S8. The Ullman-type polymerization as the possible route to synthesize the TOC-based sheets.

Table S1. Calculated parameters and assignment of the vertical electronic transitions in the electronic absorption spectrum of the compounds **1–5** at the B3LYP/3–21G Level

μ_z – magnetic dipole moment along the z axis (β – Bohr magneton);

M_x – electric dipole moment along the x axis;

λ – wavelength;

f_{vac} – oscillator strength, calculating in a vacuum.

Table S3. Total energy of the ground singlet state (${}^1\text{A}_{1g}$) of the compounds **1–5** at the B3LYP/6–21G(d) level of theory

	9	–10346.5556
	16	–18332.7859

The 6-21G(d) double-valence split basis set affords us to optimize all studied systems which consist at the most of 486 atoms (TOC ribbon, n=16). The extension of the chosen basis set prevents optimization of all studied molecules at the uniform level of accuracy. For comparison we have optimized the sheet **1** with the 6-311++G(d,p) basis. The calculated deviations in the structural parameters are negligible (no more than 0.002 Å for the bond lengths) and all conclusions remain. Thus, the choice of the 6-21G(d) basis set is quite justified by a very big size of the studied systems.

Table S4. The optimized Cartesian coordinates of the compound **1** calculated at the B3LYP/6–21G(d) level of theory
