Figure S1. XPS Cu  $2p_{3/2}$  spectrum of  $\text{Cu}_{0.04}\text{Bi}_2\text{Te}_3$  composite.

Although the XPS spectrum was not very sharp due to the small content of Cu in the composite, the binding energy exhibited a maximum peak around 933 eV and it was quite consistent to the reported values. In literature, the binding energy of Cu has been reported to be  $\sim 933$  eV regardless of its oxidation state (Cu,  $\text{Cu}_2\text{Te}$ ,  $\text{CuTe}$ ).<sup>S1-S3</sup> Especially, Teeter reported that the binding energies for  $\text{Cu}^0$ ,  $\text{Cu}^{1+}$  and  $\text{Cu}^{2+}$  were equal within about 0.05 eV.<sup>S1</sup> Although the identification of the oxidation state of the doped Cu was not possible due to the similarity in their binding energies, our result clearly reveals the existence of Cu-Te bonding in the  $\text{Cu}_x\text{Bi}_2\text{Te}_3$  composite.
