# Synthesis, in silico, \& in vitro characterization of novel dihydropyrimidones that target peroxisome proliferator-activated receptor- $\gamma$ 

Hanumantharayappa Bharathkumar, Shardul Paricharak, Koragere Rajashekar Dinesh, Kodappully Sivaraman Siveen, Julian E. Fuchs, Shobith Rangappa, Chakrabhavi Dhananjaya Mohan, Nima Mohandas, Alan Prem Kumar, Gautam Sethi, Andreas Bender, Basappa, and Kanchugarakoppal Subbegowda Rangappa<br>\section*{Supplementary Data}

## Chemistry

Materials and methods: All the chemicals are purchased from Sigma-Aldrich unless otherwise mentioned specifically. Melting points were determined in capillaries on a Tottoli apparatus and are uncorrected. The NMR experiments ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$, were carried out at 400 MHz and the reported chemical shifts ( $\delta$ ) are given in ppm and the coupling constants (J) in Hertz (Hz). Multiplicities of NMR signals are designed as $s$ (singlet), $d$ (doublet), $m$ (multiplet, for unresolved lines). Mass spectra were recorded on a Trio 1000 Thermo Quest spectrometer in the electron impact mode or a Platform Micromass spectrometer in the electro spray mode. TLC was performed on silica gel Alugram SilG/UV254 (Macherey-Nagel).

## General Procedure for the Synthesis of dihydropyrimidones

To a 50 mL round bottom flask, aldehyde (1.0 equiv), urea (1.5 equiv), diketone (1.0 equiv), ZnO (3 molecular \%) and water ( 10 mL ) were added. The reaction mixture was refluxed for 3 h . Then the solid was filtered, dried and purified by column chromatography (Figure 1).

1. Synthesis of ethyl 6-methyl-2-oxo-4-(4-oxo-4H-chromen-3-yl)-1,2,3,4-
tetrahydropyrimidine-5-carboxylate (4a):

The product 4a was obtained from 4-oxo-4H-chromene-3-carbaldehyde $\mathbf{1 a}(174 \mathrm{mg}, 1 \mathrm{eq})$, urea ( $90 \mathrm{mg}, 1.5 \mathrm{eq}$ ) and ethyl 3-oxobutanoate (130mg 1eq). This compound was obtained as light brown color solid in $95 \%$ yield. Melting point: 288-290 ${ }^{\circ} \mathrm{C}$

IR vmax (KBR, $\mathbf{c m}^{-1}$ ): 3234(N-H), 1722(ester), 1643(Amide)
${ }^{\mathbf{1}} \mathbf{H}$ NMR (400 MHz, DMSO $\boldsymbol{\delta}$ in ppm) 1.09 (3H,s,methyl), 2.26 (3H,s, methyl) 4.01 (2H,q,methylene), 5.24 ( $1 \mathrm{H}, \mathrm{s}$, methyne), $7.23(1 \mathrm{H}, \mathrm{s}$, Aromatic H) $7.51(1 \mathrm{H}, \mathrm{t}$, Aromatic H), 7.66 $(1 \mathrm{H}, \mathrm{d}$, Aromatic H$), 7.79(1 \mathrm{H}, \mathrm{t}$, Aromatic H$), 8.08(1 \mathrm{H}, \mathrm{d}$, Aromatic H$), 8.16(1 \mathrm{H}, \mathrm{s}, \mathrm{N}-\mathrm{H})$, $9.23(1 \mathrm{H}, \mathrm{s}, \mathrm{N}-\mathrm{H})$;
$\mathbf{C}^{\mathbf{1 3}} \mathbf{N M R \delta}: 14.09,17.95,48.11,59.02,94.95,118.39,123.70,124.57,124.98,125.49,134.17,150.09,1$ $51.96,154.73,155.66,165.05,175.38$

2. Synthesis of 5-acetyl-6-methyl-4-(4-oxo-4H-chromen-3-yl)-3,4-dihydropyrimidin-2(1H)one(4b):

The product $\mathbf{4 b}$ was obtained from 4-oxo-4H-chromene-3-carbaldehyde $\mathbf{1 b}$ ( $174 \mathrm{mg}, 1 \mathrm{eq}$ ), urea ( $90 \mathrm{mg}, 1.5 \mathrm{eq}$ ) and acetyl acetone ( 100 mg 1 eq ). This compound was obtained as brown color solid in $92 \%$ yield. Melting point: $138-140^{\circ} \mathrm{C}$

IR vmax (KBR, $\mathbf{c m}^{-1}$ ): 3330(N-H), 1710(ketone), 1697(Amide).

## Biology

Cell Lines: Human hepatocellular carcinoma (HCC) cell line HepG2 was obtained from American Type Culture Collection (Manassass, VA). HCC cell lines, HCCLM3 and HUH-7, and normal human liver cell line, LO2, were kindly provided by Prof. Kam Man Hui, National Cancer Centre, Singapore. All the cell lines were cultured in Dulbecco's Modified Eagle Medium (DMEM) containing 1X antibiotic-antimycotic solution with $10 \%$ FBS.

Cytotoxicity Studies: The anti-proliferative effect of dihydropyrimidones against various HCC cell lines (HepG2, HCCLM3 and HUH-7) and normal human liver cells, LO2, was determined by the MTT dye uptake method. The cells ( $5 \times 10^{3} /$ well $)$ were incubated in triplicate experiments in a 96 -well plate in the presence or absence of indicated concentrations of the pyrimidones in a final volume of 0.2 ml for indicated time points at 37 ${ }^{\circ} \mathrm{C}$. Thereafter, $20 \mu \mathrm{l}$ of MTT solution ( $5 \mathrm{mg} / \mathrm{ml}$ in PBS) was added to each well. After a 4-h incubation in the dark at $37{ }^{\circ} \mathrm{C}, 0.1 \mathrm{ml}$ of lysis buffer ( $20 \% \mathrm{SDS}, 50 \%$ dimethylformamide) was added and incubated for 2 h at $37^{\circ} \mathrm{C}$, followed by measurement of optical density at 570 nm by Tecan plate reader (Durham, NC).

In silico ligand similarity studies: Given the constantly increasing amount of bioactivity
data available, we attempted to rationalize the mode-of-action of the experimentally active compounds using in silico approaches, which are currently the topic of many chemogenomics studies. ${ }^{1,2}$ In order to achieve this, we applied the Laplacian-modified Naïve Bayesian classifier to predict potential targets for the compounds which were experimentally tested, as deployed by Koutsoukas et al. ${ }^{3}$ This classifier was trained on a large dataset extracted from ChEMBL ${ }^{4}$ comprising approximately 190,000 bioactive compounds covering 477 human protein targets. Proteins with a minimum log-odds score of 10 were considered as possible targets.

Westernblot analysis: We performed Westernblot analysis for detection of various proteins. Compound 4 g treated whole-cell extracts were lysed in lysis buffer ( $20 \mathrm{mMTris}(\mathrm{pH} 7.4$ ), $250 \mathrm{mM} \mathrm{NaCl}, 2 \mathrm{mM}$ EDTA ( pH 8.0 ), $0.1 \%$ TritonX-100, $0.01 \mathrm{mg} / \mathrm{ml}$ aprotinin, 0.005 $\mathrm{mg} / \mathrm{ml}$ leupeptin, 0.4 mM PMSF, and 4 mM NaVO 4$)$. Lysates were then spun at $14,000 \mathrm{rpm}$ for 10 min and resolved on a $10 \% \mathrm{SDS}$ gel. After electrophoresis, the proteins were electrotransferred to a nitrocellulose membrane, blocked with Blocking One (Nacalai Tesque Inc, Kyoto, Japan), and probed with various primary antibodies (1:1000) overnight at $4^{\circ} \mathrm{C}$. The blot was washed, exposed to HRP-conjugated secondary antibodies for 1 h , and finally examined by chemiluminescence (ECL; GE Healthcare, Little Chalfont, Buckinghamshire, UK).

PPR- $\gamma$ activation studies: To determine PPAR $-\gamma$ activation, we performed DNA binding assays using TransAM PPAR- $\gamma$ Transcrption Factor Kit from Active Motif according to the manufacturer's instructions. Nuclear extract of HepG2 cells treated with compound $\mathbf{4 g}$ for different time periods was prepared using nuclear extraction kit from Active Motif, according to the manufacturer's protocol. Briefly, 10 mg of nuclear proteins were added into

96-well plate coated with an unlabeled oligonucleotide containing the consensus binding site for PPAR- $\gamma$ ( $5^{\prime}$-AACTAGGNCAAAGGTCA-3') and incubated for 1 h . The wells were washed and incubated with antibodies against PPAR- $\gamma$ for 1 h . A horseradish peroxidase (HRP) conjugated secondary antibody was then applied to detect the bound primary antibody and provided the basis for colorimetric quantification. The enzymatic product was measured at 450 nm by microplate reader (Tecan Systems).

In silico molecular docking studies: The co-crystal structure of human PPAR- $\gamma$ in complex with rosiglitazone (PDB: 4EMA) was used for the structure-based molecular docking studies. ${ }^{4}$ The software InsightII from Accelrys was used to obtain a full set of tools for molecular modeling, which includes molecular graphics and forcefield-based simulations. Molecular modeling was performed with the commercially available InsightII packages from Discovery Studio (DS) Version 2.5. Before performing the CDOCKER protocol of DS, the 3D structure of the rosiglitazone bound PPAR- $\gamma$ copy was cleaned, and the size and spatial orientation of the LBD was identified. All calculations were performed using the CHARMM force field. Each energy-minimized final docking position of the dihydropyrimidones was evaluated using the interaction score function implemented in the CDOCKER module. The predicted binding pose of compound $\mathbf{4 g}$ was compared against the known binding pose of rosiglitazone (PDB: 4EMA).

Migration Assay: The migration of HepG2 cells was investigated using a wound healing assay. An IBIDI culture insert (ibidi GmbH, Munich, Germany) consists of two reservoirs separated by a $500 \mu \mathrm{~m}$ thick wall created by a culture insert in a 35 mm petri dish. For the migration assay, an equal number of HepG2 cell ( $70 \mu 1 ; 5 \times 10^{5}$ cells $/ \mathrm{ml}$ ) was added into the two reservoirs of the same insert and incubated at $37^{\circ} \mathrm{C} / 5 \% \mathrm{CO} 2$. After 12 h , the insert was
gently removed creating a gap of $\sim 500 \mu \mathrm{~m}$. The cells were pretreated with the PPAR $-\gamma$ inhibitor GW9662 ( $20 \mu \mathrm{M}$ for 2 h ), followed by incubation with compound $\mathbf{4 g}$ for 8 h . The cells were also treated either with $25 \mu \mathrm{M}$ compound $\mathbf{4 g}$ alone for 8 h or GW9662 alone ( 20 $\mu \mathrm{M}$ for 2 h ). After incubation, the wounds were observed using bright field microscopy and multiple images were taken at areas flanking the intersections of the wound. The gap distance of the wound was measured at three different sites using Photoshop software, and data were normalized to the average of the control. Graphs were plotted against the percentage of migration distance the cells moved before and after treatment, as well normalized to the control.

Invasion Assay: The in vitro tumor cell invasion assay was performed using the Bio-Coat Matrigel invasion assay system (BD Biosciences, San Jose, CA, USA), according to the manufacturer's instructions. $1 \times 10^{5} \mathrm{HepG} 2$ cells were suspended in serum-free DMEM and seeded into the Matrigel transwell chambers consisting of polycarbonate membranes with 8 $\mu \mathrm{m}$ pores. The cells were pretreated with GW9662 ( $20 \mu \mathrm{M}$ for 2 h ), followed by incubation with compound $\mathbf{4 g}$ for 8 h . The cells were also treated either with $25 \mu \mathrm{M}$ compound $\mathbf{4 g}$ alone for 8 h or GW9662 alone ( $20 \mu \mathrm{M}$ for 2 h ). After incubation, the upper surfaces of the transwell chambers were wiped with cotton swabs, and the invading cells were fixed and stained with crystal violet solution. The invading cells were then counted in five randomly selected areas under microscopic observation.

Statistical analysis was done using a software Origin 8 (OriginLab). The Mann-Whitney U test was used to determine P -values
