

Supplementary Information

Short Ligands Offer Long-Term Water Stability and Plasmon Tunability for Silver Nanoparticles

Serene Bayram, Omar K. Zahr and Amy Szuchmacher Blum

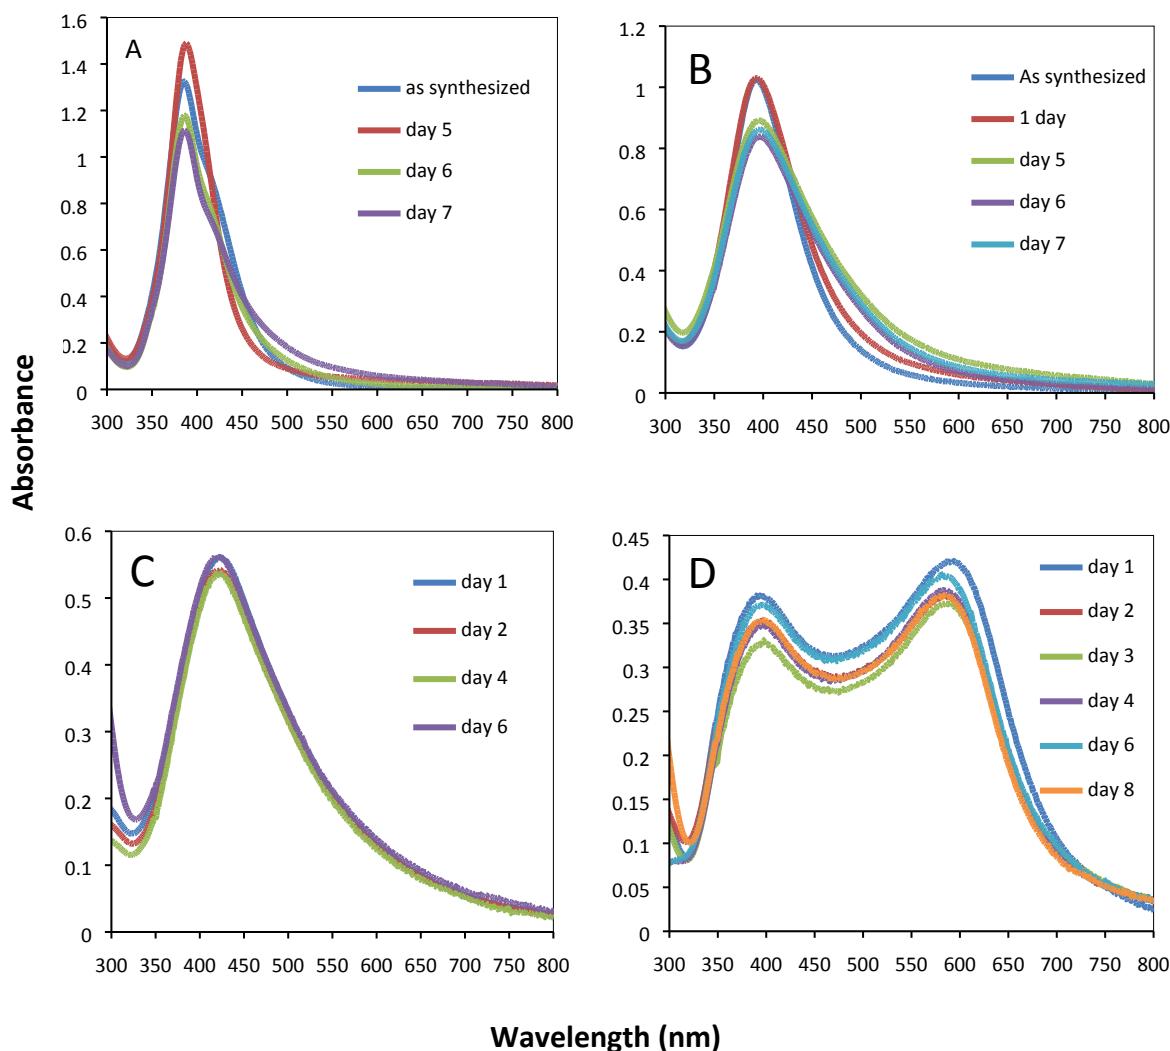

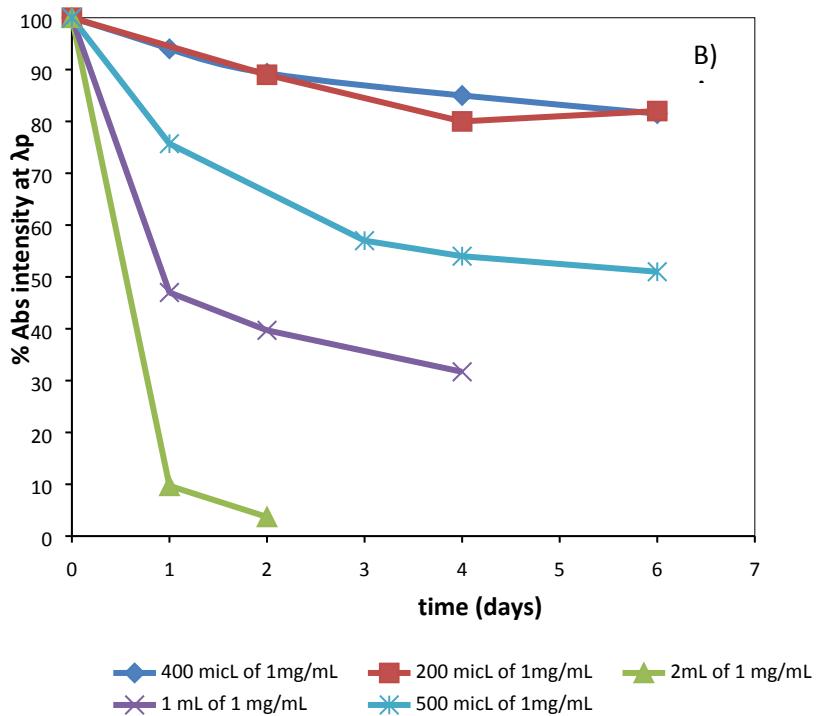

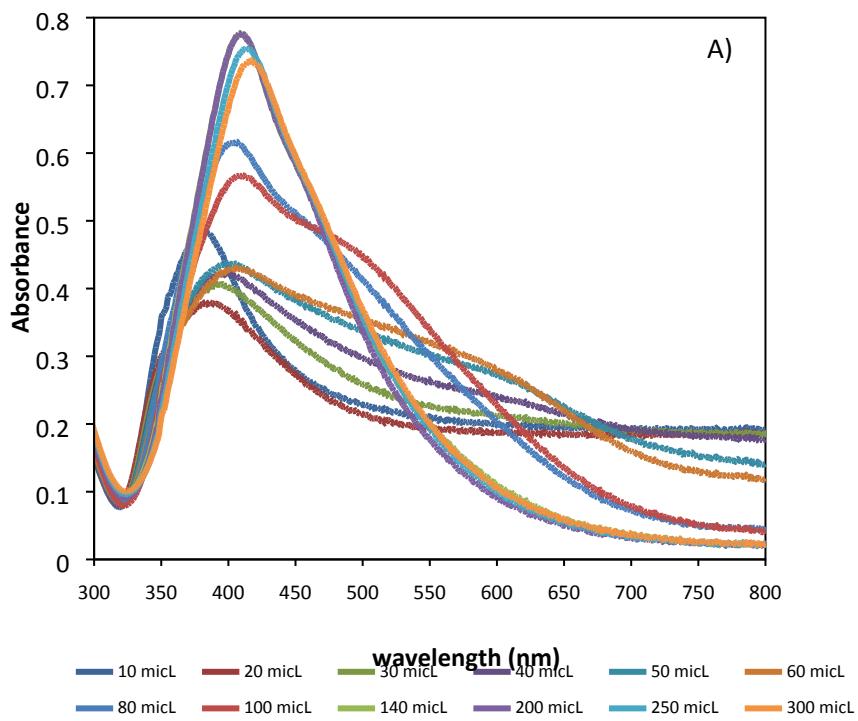

Figure SI-1: Full extinction spectra collected over time for AgNPs stabilized by A): glycine, B): cysteine, C): DTT and D): cysteamine.

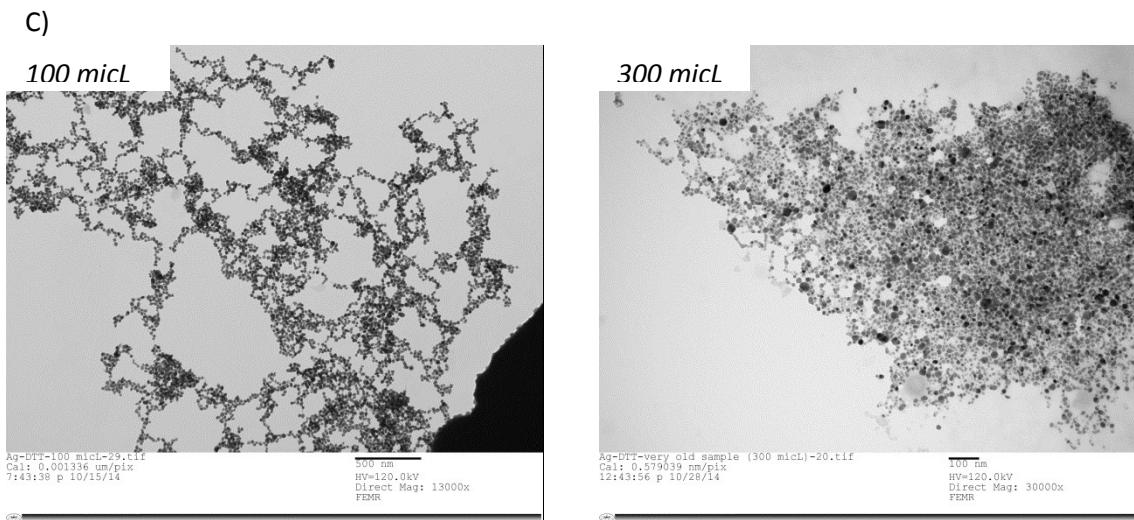

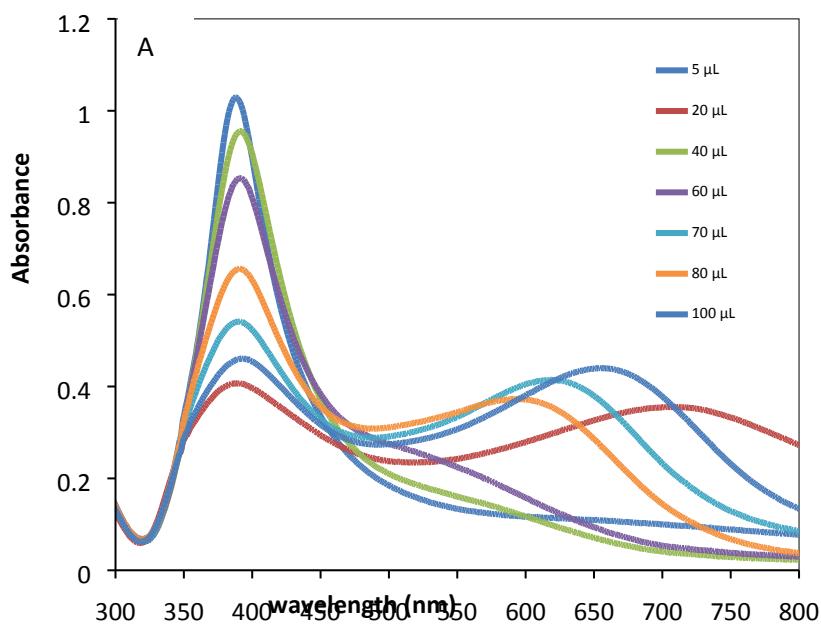

Figure SI-2: Effect of DTT:AgNP molar ratio on A) extinction spectra, B) stability and C) cross-linking of AgNPs . Similar effects were noticed for AgNPs modified with cysteine and cysteamine ligands.

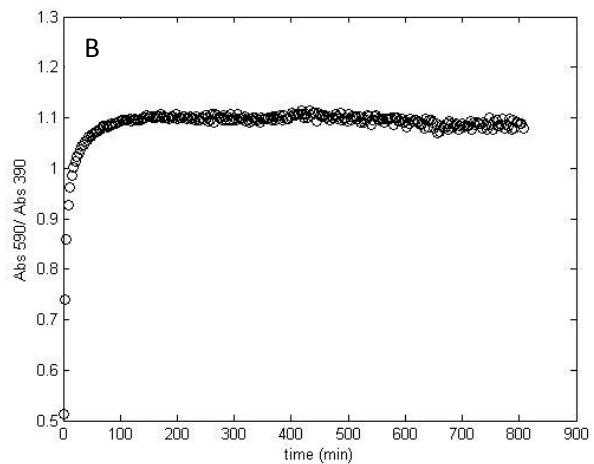

Figure SI-3. A) Extinction spectra of Ag-cysteamine in the presence of different amounts of 3.9 mM cysteamine solution. B) Kinetic evolution of $\text{Abs}_{590}/\text{Abs}_{390}$ of Ag-cysteamine colloid (100 μL of 3.9 mM of cysteamine solution was used).

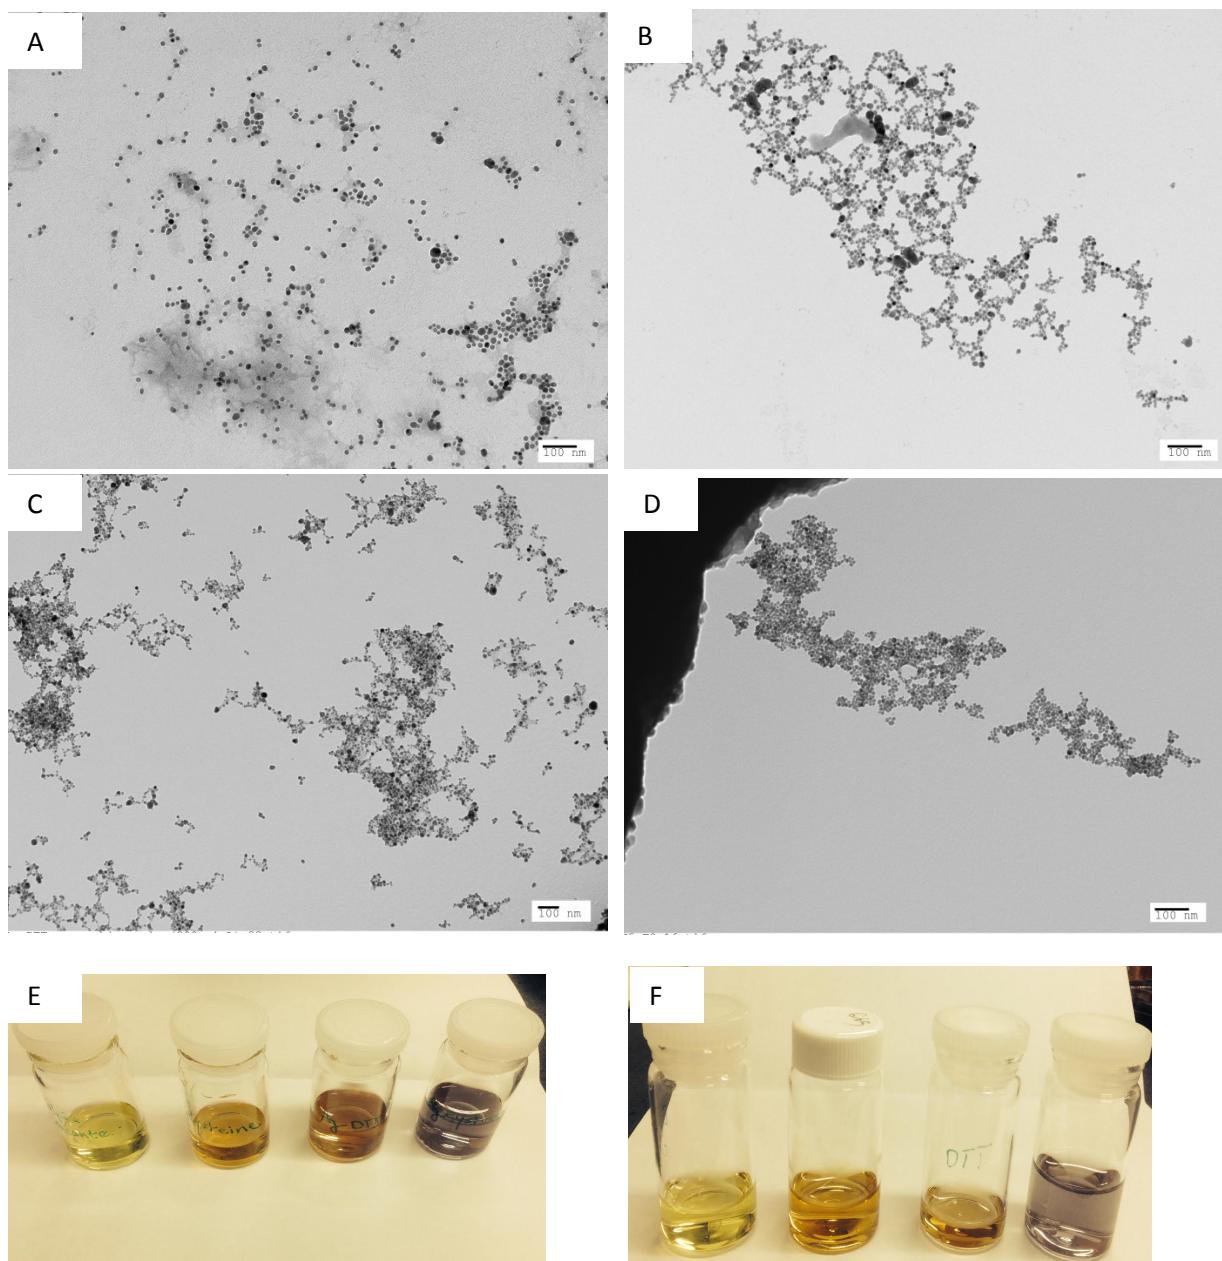

Figure SI-4. TEM micrographs of A) Ag-glycine after 7 days; B) Ag-cysteine after 5 days; C) Ag-DTT after 3 months; D) Ag-cysteamine after 8 days. E and F) Photographs of AgNPs on the day of synthesis and after 25 days, respectively (From left to right: Ag-glycine, Ag-cysteine, Ag-DTT and Ag-cysteamine).
