

Electronic Supplementary Information

Synthesis of two copper clusters and their catalysis towards the oxidation of benzene into phenol

IR and UV–vis spectra for clusters **1** and **2**

In IR spectra of clusters **1** and **2**, the peaks at about 1607, 1489 and 1442 cm^{-1} are belonged to pyridinyl and phenol rings vibrations. The peak at 625 cm^{-1} is ascribed to Cl=O vibration of ClO_4^- groups. In MeCN solvent, the absorption bands in **H₂L^I** and **H₂L^{II}** at about 218 nm are the π – π^* transition of pyridine and phenol groups; the other peaks at about 255 nm are ascribed to the n– π^* transitions of ligands, Figure S1.

While for clusters **1** and **2** in MeCN, the similar absorption bands at about 225 and 255 nm are also ascribed to the π – π^* and n– π^* transition of ligands. There are new absorption bands appearing at about 299 nm in clusters **1** and **2**, which are belonged to ligand to metal charge transfer (LMCT) absorption band. The d–d transition of Cu^{2+} ions in both clusters at the long wave range is very weak.

Figure S1 UV-vis absorption of ligands $\text{H}_2\text{L}^{\text{I}}$ and $\text{H}_2\text{L}^{\text{II}}$ and clusters **1–2** (1.0×10^{-4} mol L^{-1} in MeCN).

Figure S2 Six copper atoms connected with O atoms to form the two parallel three-site strings configuration, carbon atoms were omitted for clarity. Four hydrogen bonds

O–H···O connected a cation $[\text{Cu}_6(\text{L}^{\text{I}})_2(\text{OH})_4]^{2+}$ with two ClO_4^- anions.

Figure S3 Six intermolecular hydrogen bonds O–H···O connected with a cation $[\text{Cu}_9(\text{L}^{\text{II}})_3(\text{OH})_7]^{5+}$ and two ClO_4^- anions, and one intramolecular hydrogen bond O5–H2'···O13 within the nonanuclear core. Carbon atoms were omitted for clarity.

Figure S4 The positive-ion ESI mass spectrum of **1** (upper), and the observed (middle) and calculated (lower) isotopic patterns for $(\mathbf{1} - 2\text{ClO}_4^-)^{2+}$ cation.

Figure S5 The positive-ion ESI mass spectrum of **2** (upper), and the observed (middle) and calculated (lower) isotopic patterns for $(\mathbf{2} + 4\text{H}^+)^{4+}$ cation.

Figure S6 The ^1H NMR spectrum of cluster **1** in CD_3CN showing the signals of two types of methyl protons.

Figure S7 The ^1H NMR spectrum of cluster **2** in CD_3CN showing the signals of three types of methyl protons.

Figure S8 Two types of methyl groups in cluster **1** highlighted in blue and purple, respectively.

Figure S9 Three types of methyl groups in cluster **2** with methyl groups on the horizontal bar of the twisted “*H*” (blue) and the other two types of methyl groups with similar chemical environment on the vertical bars of the twisted “*H*” (green and purple, respectively). For clarity, only one third of $[\text{Cu}_9(\text{L}^{\text{II}})_3(\text{OH})_7]$ core was shown.

Alternating current magnetic susceptibility measurements were performed on **1** and **2** in the 2–20 K range under a zero dc field. As shown in Figure S10, no frequency dependence of the ac susceptibility is observed in **1** and **2**. The magnetization versus field curves for **1** and **2** were measured at 2 K under a field of 70 kOe (Figure S11).

As the applied field increases, a rapid increase below about 40 kOe followed by a much slower increase led to a magnetization of 1.86 N β for **1** and 2.85 N β for cluster **2** at 70 kOe. No inflection point was found in the M - H curves at 2 K.

Figure S10 Temperature dependence of the in-phase and Out-of-phase dynamic susceptibility for clusters **1** (above) and **2** (below) under a zero dc field.

Figure S11 Magnetization data for clusters **1** and **2** at 2 K.

Table S1 Crystallographic data for clusters **1** and **2**.
