Instrumentation and Materials

¹H NMR (600 MHz) spectra were taken on a JEOL ECA-600 spectrometer, and chemical shifts were reported as the delta scale in ppm relative to CHCl₃ as internal reference for ¹H NMR (δ = 7.260 ppm). UV/Vis absorption spectra were recorded on a Shimadzu UV-2550 spectrometer. Mass spectra were recorded on a Shimadzu AXIMA-CFRplus using positive-MALDI-TOF method with matrix. X-Ray data were taken on a Bruker SMART APEX X-Ray diffractometer equipped with a large area CCD detector. Preparative separations were performed by silica gel gravity column chromatography (Wako gel C-300). Thin-layer chromatography (TLC) was carried out on aluminum sheets coated with silica gel 60 F254 (Merck 5554). Recycling preparative GPC-HPLC was carried out on a JAI LC-908 using preparative JAI-GEL-2.5H, 3H, and 4H columns (chloroform eluant; flow rate 3.8 mL min⁻¹). Unless otherwise noted, materials obtained from commercial suppliers were used without further purification.

General Procedure

Synthesis of 2Br: A toluene-DMF solution (4 mL/2 mL) of **1** (140 mg, 0.124 mmol), 2,5-dibromothiophene (2.0 μ L, 0.0177 mmol), Pd₂(dba)₃ (1.6 mg, 0.00177 mmol), PPh₃ (1.9 mg, 0.007 mmol), Cs₂CO₃ (11.5 mg, 0.035 mmol), and CsF (5.4 mg, 0.035 mmol) was degassed through three freeze-pump-thaw cycles, and the reaction flask was purged with argon. UV-vis., and ^1H NMR studies of **4Ni** with C_{60} and job's plot

Typical procedure of UV-vis. titration

An aliquot of a solution of C_{60} (3.2×10^{-3} M in toluene) was added to a solution of **4Ni** (2.0×10^{-6} M in toluene), and the resulting solutions were subjected to UV-vis. spectroscopy at 25°C (Figure S12). The spectrum was corrected with a dilution factor and background subtraction. The difference in absorbance of **4Ni** induced by the addition of C_{60} was measured at 438 nm. Binding curves were obtained by plotting y against C_{60} , where y denotes a fraction of complex **4Ni-C**₆₀ and defined as $y = (\text{Abs}_{\text{obs}} - \text{Abs}_0) / (\text{Abs}_\infty - \text{Abs}_0)$ where Abs_0 , Abs_∞ is Abs_{obs} at $\text{C}_{60} = 0$ and infinite, respectively (Figure S12, inset). The analysis of the spectral data provided a value of $\log K = 7.7 \pm 0.6$, $N = 1.6$.

Typical procedure of job's plot

Solution of **4Ni** and C_{60} (each 0.02 mM in toluene) were mixed to prepare 12 samples (each 0.3 mL) with varying mole fractions of **4Ni** from 0 to 1, which were subjected to UV-vis spectroscopies at 25°C . Absorbance values at 438 nm were normalized to the maximal increase ΔAbs in absorbance with the following equation, $\Delta\text{Abs} = \text{Abs}_{\text{obs}} - \text{Abs}_{\text{ref}}$, where Abs_{ref} is absorbance of **4Ni** in the absence of C_{60} under the same concentration of **4Ni** in the conditions of Abs_{obs} . Job's plot was obtained by plotting ΔAbs values against mole fractions of **4Ni** (Figure S13).

Inset: a titration curve of **4Ni** under various concentration of $[\text{C}_{60}]$. Low concentration area is enlarged at right side.

Explanation for a "level A" alert: Since the crystals contained many severely disordered solvent molecules, they gave only weak diffractions. However, these are not significant concern for the main skeletal structure.

Explanation for a "level A" alert: The alert comes from the rotational disorder of *tert*-Butyl groups.
