1 Experimental Details

The enamines under investigation were created *in situ* by mixing freshly distilled aldehydes **1** or **2** (30 μmol) with a solution of 100 mol% of one the organocatalysts **3-9** in 0.6 mL of a deuterated solvent within a standard 5 mm NMR tube. The NMR tube was transferred to the spectrometer immediately after the preparation of the reaction mixture.

NMR measurements were performed at 300 K on a Bruker Avance DRX 600 (600.13 MHz) and on a Bruker Avance III 600 (600.25 MHz) spectrometer, the latter equipped with a TCI cryoprobe with z-gradient (53.5 G/cm). ¹H, ¹H-NOESY spectra were recorded using a mixing time of 700 ms. NMR data were processed and evaluated with Bruker's TOPSPIN 2.1.

Spartan '06 (<http://www.wavefun.com>) was employed for the structure models displayed in Figure 4B. The structures were refined with the help of molecular mechanics conformer distribution calculations (MMFF force field).

2 NMR Characterization of Enamines

	DMSO-d ₆	DMSO-d ₆	MeCN-d ₃	MeOH-d ₄	CDCl ₃	PhMe-d ₈
			not detected	not detected		
			not detected	not detected		
			not detected	not detected		
			not detected	not detected		
			not detected	not detected		

Scheme S1 Overview of the prolin enamines, relevant ¹H chemical shifts and coupling constants.
 (Note: Chemical shifts of Hβ1, Hγ1 and Hδ1 are listed below those of Hβ2, Hγ2, Hδ2.)

$\delta(^1\text{H})$ / ppm
 $^3\text{J}(\text{H}\alpha, \text{H}\beta 1/2)$ / Hz
 $^3\text{J}(\text{H}\gamma 1, \text{H}\delta 2)$ / Hz
