S1. General Procedure

Techniques:

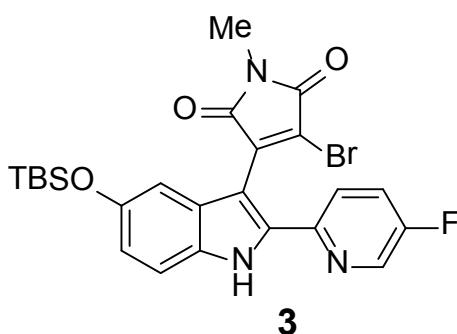

Reactions were carried out using heat gun-dried glassware and were conducted under nitrogen atmosphere. NMR spectra were recorded under standard conditions on a *Bruker Avance 300* spectrometer ($\nu = 300$ MHz for ^1H , $\nu = 75$ MHz for ^{13}C), *Bruker DRX-400* spectrometer ($\nu = 400$ MHz for ^1H , $\nu = 100$ MHz for ^{13}C) or *Bruker DRX-500* spectrometer ($\nu = 500$ MHz for ^1H , $\nu = 125$ MHz for ^{13}C). Spectra were calibrated to the residual solvent peaks. Infrared spectra of the solid products were recorded on a *Bruker Alpha-P FT-IR-Interferometer* or *Bruker Tensor 37* using *Opus 6.5* for data evaluation. Absorptions are noted in wave numbers ($\tilde{\nu}$). HR-ESI mass spectra were acquired with a LTQ-FT mass spectrometer (Thermo Fischer Scientific). The resolution was set to 100.000. HR-APCI mass spectra were acquired with a LTQ-FT mass spectrometer (Thermo Fischer Scientific). The resolution was set to 100.000. HR-EI mass spectra were acquired with a MAT95 double focusing sector field mass spectrometer (Finnigan). An internal standard (PFK) was used for mass calibration. Ion mass m/z are noted in u. Reagents and solvents were used as received from standard suppliers. Pyridylindoles were synthesized according to literature.^[1] Potassium *tert*-butyl 2-(difluoroboryl)-5-(triisopropylsilyloxy)-1*H*-indole-1-carboxylate fluoride was synthesized according to literature.^[2] Maleanimides were synthesized according to literature. Reaction progress were controlled by thin layer chromatography using plates purchased from *Merck* (Silica 60 F₂₅₄) and optical evaluation using a UV-lamp of 254 nm or 366 nm wavelength. Chromatographic separations were performed using Silica 60 (grit size 40-63 μm) purchased from *Merck*.

S2. General procedure for the synthesis of monobromides:

A solution of corresponding pyridylindole (1.0 eq), was dissolved in dry THF and stirred at -15°C under nitrogen. Lithium bis(trimethylsilyl)amide (1 M solution in hexanes) (3.0 eq) was added to the solution over 30 min. A solution of corresponding maleanimide (1.1 eq) in dry THF was added to the yellow solution over 15 min. The dark purple solution was allowed to stir for another 30 min at -15°C and then at RT overnight. The solution was poured into aq. 10% HCl, which was cooled to 0°C , and extracted three times with EtOAc. The combined organic phases were washed with sat. aq. NaCl solution and dried over NaSO_4 . The solvent was evaporated and concentrated to dryness *in vacuo*. The crude material was subjected to silica gel chromatography with hexane-ethylacetate or dichloromethane. The combined product eluents were dried *in vacuo* to obtain the product as a solid. (Several signals in the $^1\text{H-NMR}$ and $^{13}\text{C-NMR}$ spectra are split due to the presence of two conformers and reported as multiple signals (e.g. 2x s for two split singletts). If mentioned case is true for certain signals in $^1\text{H-NMR}$ spectra, then relevant peaks of the minor conformer are given in brackets. Signals in $^{13}\text{C-NMR}$ spectra are only given for the main conformer.)

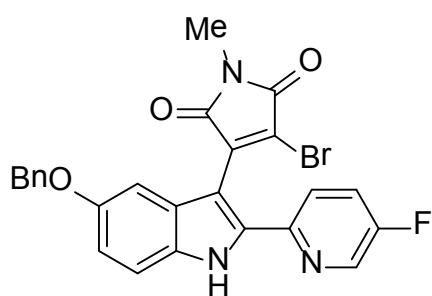

2-(5-fluoropyridin-2-yl)-5-(triisopropylsilyloxy)-1*H*-indole **S1.** Potassium *tert*-butyl 2-(difluoroboryl)-5-(triisopropylsilyloxy)-1*H*-indole-1-carboxylate fluoride (800 mg, 1.6 mmol, 1.0 eq) was dissolved in dimethoxyethane/water (14 mL, 3.5/1) and purged with nitrogen for 10 min. Tetrakis(triphenylphosphine)palladium (184 mg, 0.16 mmol, 0.1 eq) were added. The reaction mixture was purged for additional 10 min with nitrogen, followed by adding 2-bromo-5-fluoropyridine (262 mg, 1.5 mmol, 0.95 eq). The reaction mixture was refluxed for 18 h under nitrogen atmosphere. The orange solution was cooled to room temperature and diluted with water (15 mL). The Aqueous layer was extracted with ethylacetate (5 x 15 mL). The combined organic phases were washed with sat. aq. NaCl solution and dried over NaSO₄. The solvent was evaporated and concentrated to dryness *in vacuo*. The crude material was subjected to silica gel chromatography with hexane-ethylacetate (10:1). The resulting yellow oil was charged on silica gel and heated to 80 °C *in vacuo* for 18 h. The product was washed off with ethylacetate (300 mL) and concentrated to dryness *in vacuo*. Compound XX (177 mg, 4.6 mmol, 29% over two steps) was obtained as a brown oil. **¹H-NMR** (300 MHz, CDCl₃): δ = 9.32 (s, 1H), 8.40 (d, J = 2.8 Hz, 1H), 7.75 (dd, J = 8.8, 4.3 Hz, 1H), 7.44 (ddd, J = 8.7, 8.2, 2.9 Hz, 1H), 7.24 (d, J = 8.8 Hz, 1H), 7.09 (d, J = 2.3 Hz, 1H), 6.87–6.82 (m, 2H), 1.29–1.23 (m, 3H), 1.15 – 1.10 (m, 18H); **¹³C-NMR** (75 MHz, CDCl₃): δ = 158.58 (d_{C-F}, J = 255.5 Hz), 150.30, 147.00, 137.13 (d_{C-F}, J = 24.3 Hz), 136.41, 132.39, 129.85, 124.03 (d_{C-F}, J = 19.3 Hz), 120.72 (d_{C-F}, J = 4.4 Hz), 117.99, 111.77, 110.03, 100.19, 18.16, 12.85; **IR** 3460, 2943, 2866, 2327, 1624, 1548, 1459, 1449, 1386, 1288, 1226, 1153, 1118, 965, 881, 830, 785, 709, 680, 644, 586, 522, 504, 442; **HRMS** (ITMS ESI) *m/z* calculated for C₂₂H₃₀FN₂OSi⁺ 385.2111, found 385.2103.

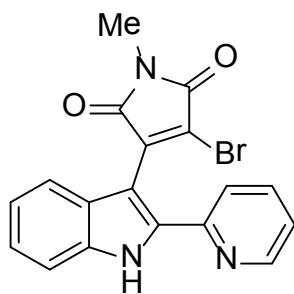

Compound 3. The synthesis was performed according to the general procedure using 5-(*tert*-butyldimethylsilyloxy)-2-(5-fluoropyridin-2-yl)-1*H*-indole (540 mg, 1.57 mmol, 1.0 eq) dissolved in dry THF (4.0 mL), Lithium bis(trimethylsilyl)amide (1 M solution in hexanes) (4.71 mL, 4.71 mmol, 3.0 eq), 3,4-dibromo-1-methyl-1*H*-pyrrole-2,5-dione (464 mg, 1.72 mmol, 1.1 eq) in dry THF (4.0 mL), aq. 10% HCl (35 mL). Aqueous layer was extracted with EtOAc (4 x 50 mL). Chromatography eluent: Hexane-Ethylacetate (3:1 to 2:1). Compound **3** (331 mg, 0.42 mmol, 27%) was obtained as a red solid. **¹H-NMR** (500 MHz, CDCl₃): δ = 9.74 (bs, 1H), 8.45 (s, 1H), 7.42–7.33 (m, 2H), 7.29 (d, J = 8.7 Hz, 1H), 6.91 (d, J

Compound 4. Compound 3 (33 mgs, 0.062 mmol) was dissolved in 33mL of toluene to provide a light yellow solution. The solution was filtered through a 0.45 micro PTFA syringe filter and the solution was primed into a Vapourtec R2C+ system. The solution was pumped through the 5mL photoreactor at 333uL/min (15min res time). The desired material was collected and concentrated to yield a dark orange solid. The material was then chromatographed over silica gel using a 3.5 Hex, 1.5 2% Et₃N/EtOAc solvent system (*Rf* – 0.21). The fraction containing product were concentrated to yield 25mgs (89% yield) of an

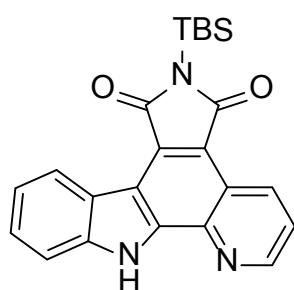

orange solid. **¹H-NMR** (400 MHz, pyridine) δ 9.44 – 9.35 (m, 1H), 9.30 (d, *J* = 2.9 Hz, 1H), 8.23 (d, *J* = 8.7 Hz, 1H), 7.77 (dd, *J* = 8.7, 2.5 Hz, 1H), 3.53 (s, 3H), 1.45 (s, 9H), 0.8 (s, 6H). **¹³C-NMR** (101 MHz, cdcl₃) δ 169.77, 168.73, 159.04, 156.47, 151.01, 141.51, 141.23, 140.54, 134.66, 134.47, 129.48, 122.62, 122.14, 122.07, 121.58, 117.20, 117.01, 114.97, 114.44, 111.91, 29.69, 25.48, 17.96, -4.32. **IR** 3327, 2928, 2857, 1755, 1694, 1565, 1528, 1472, 1442, 1417, 1378, 1333, 1281, 1250, 1224, 1170, 962, 899, 840, 807, 781, 743 **HRMS** (ITMS, ESI) m/z calculated for C₂₄H₂₅FN₃O₃Si+ 450.1649 found 450.1665

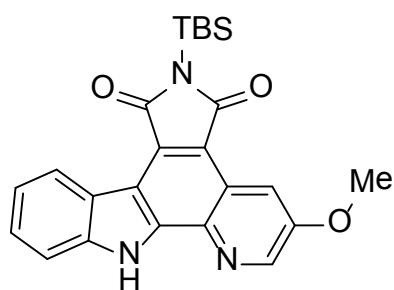

Compound 6. The starting solid (62mgs, 0.122 mmol) was dissolved in 62mL of toluene to provide a light yellow solution that was free of particulate. The solution was pushed through the 5000uL reactor at 333uL/min using the Vapourtec system. The reaction proceeded over 3 hours. As the initial product emerged from the microreactor, a red solid was observed. The material began to clog the back pressure regulator and pyridine was added to the solution in an attempt to reduce/eliminate or make the solid more free flowing. The pyridine addition made the solid more free flowing, but the solid did not dissolve. The collected suspension was centrifuged to collect the solid that was then dissolved in ethyl acetate. The EtOAc solution was pre-absorbed onto loading media and then applied to a silica gel column and eluted with 3.5 Hex, 1.5 2% Et₃N, EtOAc. The product spot (fractions 5-20) was concentrated yielding a bright orange solid (54mgs; >95% yield). **¹H NMR** (400 MHz, DMSO) δ 10.04 (br s, 1H), 9.05 (m, 1H), 8.88 (d, 1H), 8.70 (d, 1H), 7.58 (m, 3H), 7.43 (m, 2H), 7.34 (m, 2H), 5.30 (s, 2H), 3.32 (s, 3H). **¹³C NMR** (101 MHz, DMSO). δ 168.88, 168.15, 157.84, 156.14, 153.41, 141.07, 140.89, 139.99, 137.19, 135.07, 134.35, 128.60, 128.44, 127.85, 121.08, 117.28, 113.63, 113.14, 106.80, 69.71, 23.53 **IR** 3318, 1685, 1526, 1444, 1377, 1299, 1226, 742, 697 **HRMS** (ITMS, ESI) m/z calculated for C₂₅H₁₆FN₃NaO₃ 448.1073, found 448.1088.

S3 Absorption and Fluorescence Spectroscopy

The samples were prepared in chloroform of analytical grade (0.1 mM). The absorption spectra were measured in the spectral range of 270 nm < λ < 580 nm using a Lambda 750 UV/Vis spectrometer (Perkin-Elmer). The steady-state fluorescence measurements were performed using a Fluoromax 4 spectrofluorometer (Horiba Jobin Yvon) operated in single-photon-counting mode. The samples were excited at $\lambda_{\text{ex}} = 366$ nm, respectively. The emission spectra were recorded in the spectral range of 425 nm < λ_{em} < 620 nm. The fluorescence decays were also measured using the Fluoromax 4 spectrofluorometer and operated in the time-correlated single-photon-counting mode (TCSPC). A NanoLED-370 at $\lambda_{\text{ex}} = 371$ nm (pulse width = 1.1 ns) operated at a repetition rate of 1 MHz was used and the emission was detected at $\lambda_{\text{em}} = 480$ nm. The data were fitted monoexponential using the software package provided by Horiba Jobin Yvon (DAS6).
