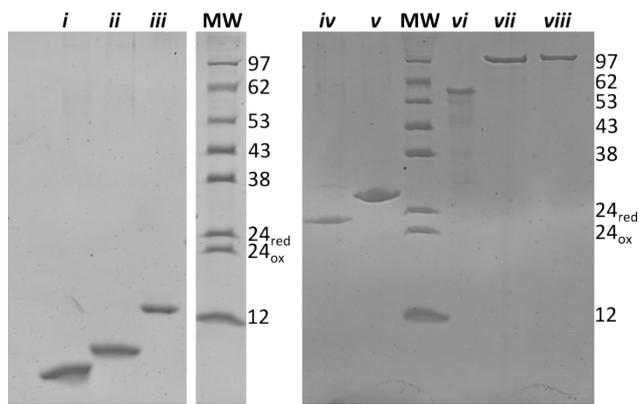

Fig. S2 SDS-PAGE analysis of protein preparations used in this study. Key to lanes: i) ACP_{5a} (calc'd: 8.9 kDa); ii) ACP_{5b} (calc'd: 9.2 kDa); iii) ACP_{5b}-DD (calc'd: 14.3 kDa); iv) ACP_{5a}-ACP_{5b} (calc'd: 19.4 kDa); v) ACP_{5a}-ACP_{5b}-DD (calc'd: 24.5 kDa); vi) KS₅-linker (calc'd: 62.2 kDa); vii) KS₅-ACP_{5a}-ACP_{5b} (calc'd: 98.5 kDa); viii) KS-ACP_{5a}-ACP_{5b}-DD (calc'd: 103.6 kDa). The molecular weights of the markers are indicated.

Fig. S3 Sequence analysis of a selection of modules (type KS-ACP-ACP and KS-ACP-ACP-ACP) from *trans*-AT PKS showing the homology to the KS-AT and post-AT linker regions of a typical *cis*-AT PKS module. The sequence of the KS-AT and post-AT linkers from module 5 of the erythromycin (DEBS) *cis*-AT PKS, for which structures are known,² are shown within and above the alignment (in blue and green, respectively), while the corresponding regions from the recently-published KS-B didomain structure of RhiE³ are shown in light blue and olive. Comparison of the KS-AT linker regions between the VirA, RhiE and DEBS modules shows that the RhiE sequence contains a large insertion. The positions of the conserved domains (based on the structure of the KS₅-AT₅ didomain of DEBS² and the NMR structures of VirA ACP_{5a} and ACP_{5b} (this work)) within the modules are also indicated in color. Key: Dif, difficidin; Vir, virginiamycin; Sna, pristnamycin; Mmp, mupirocin; Bae, bacillaene from *Bacillus amyloliquefaciens*; Pks, bacillaene from *B. subtilis*; Lnm, leinamycin; Etn, etnangien. In each case, the subunit name and module number are indicated.

Fig. S4 Sequence analysis of ACP-ACP regions in *trans*-AT PKS and PfaA. (a) Sequence alignment of the ACP-ACP regions from a selection of *trans*-AT PKS modules. In each case, the subunit name and module number are indicated. The positions of the conserved ACP domains (based on the presence of secondary structure elements in the NMR structures of Vir ACP_{5a} and ACP_{5b}) are shown for the sequence of VirA. The ACP-ACP linkers of VirA and mupirocin are highlighted in green and red, respectively. Key: Mmp, mupirocin; Mln, macrolactin; Bae, bacillaene from *Bacillus amyloquefaciens*; Alb, albicidin from *Xanthomonas albilineans* Xa23R1; Xab, albicidin from *Xanthomonas albilineans* Xa13; Dif, difficidin; Chi, chivosazol; Dis, disorazol; Lkc, lankacidin; Onn, onnamide; Vir, virginiamycin; Rhi, rhizoxin. (b) Sequence of the tandem ACP region of the PUFA synthase, PfaA (GenBank: AAL01060.1). The positions of the four ACP-ACP linkers are indicated in red, while their respective lengths and content in Pro and Ala are given.

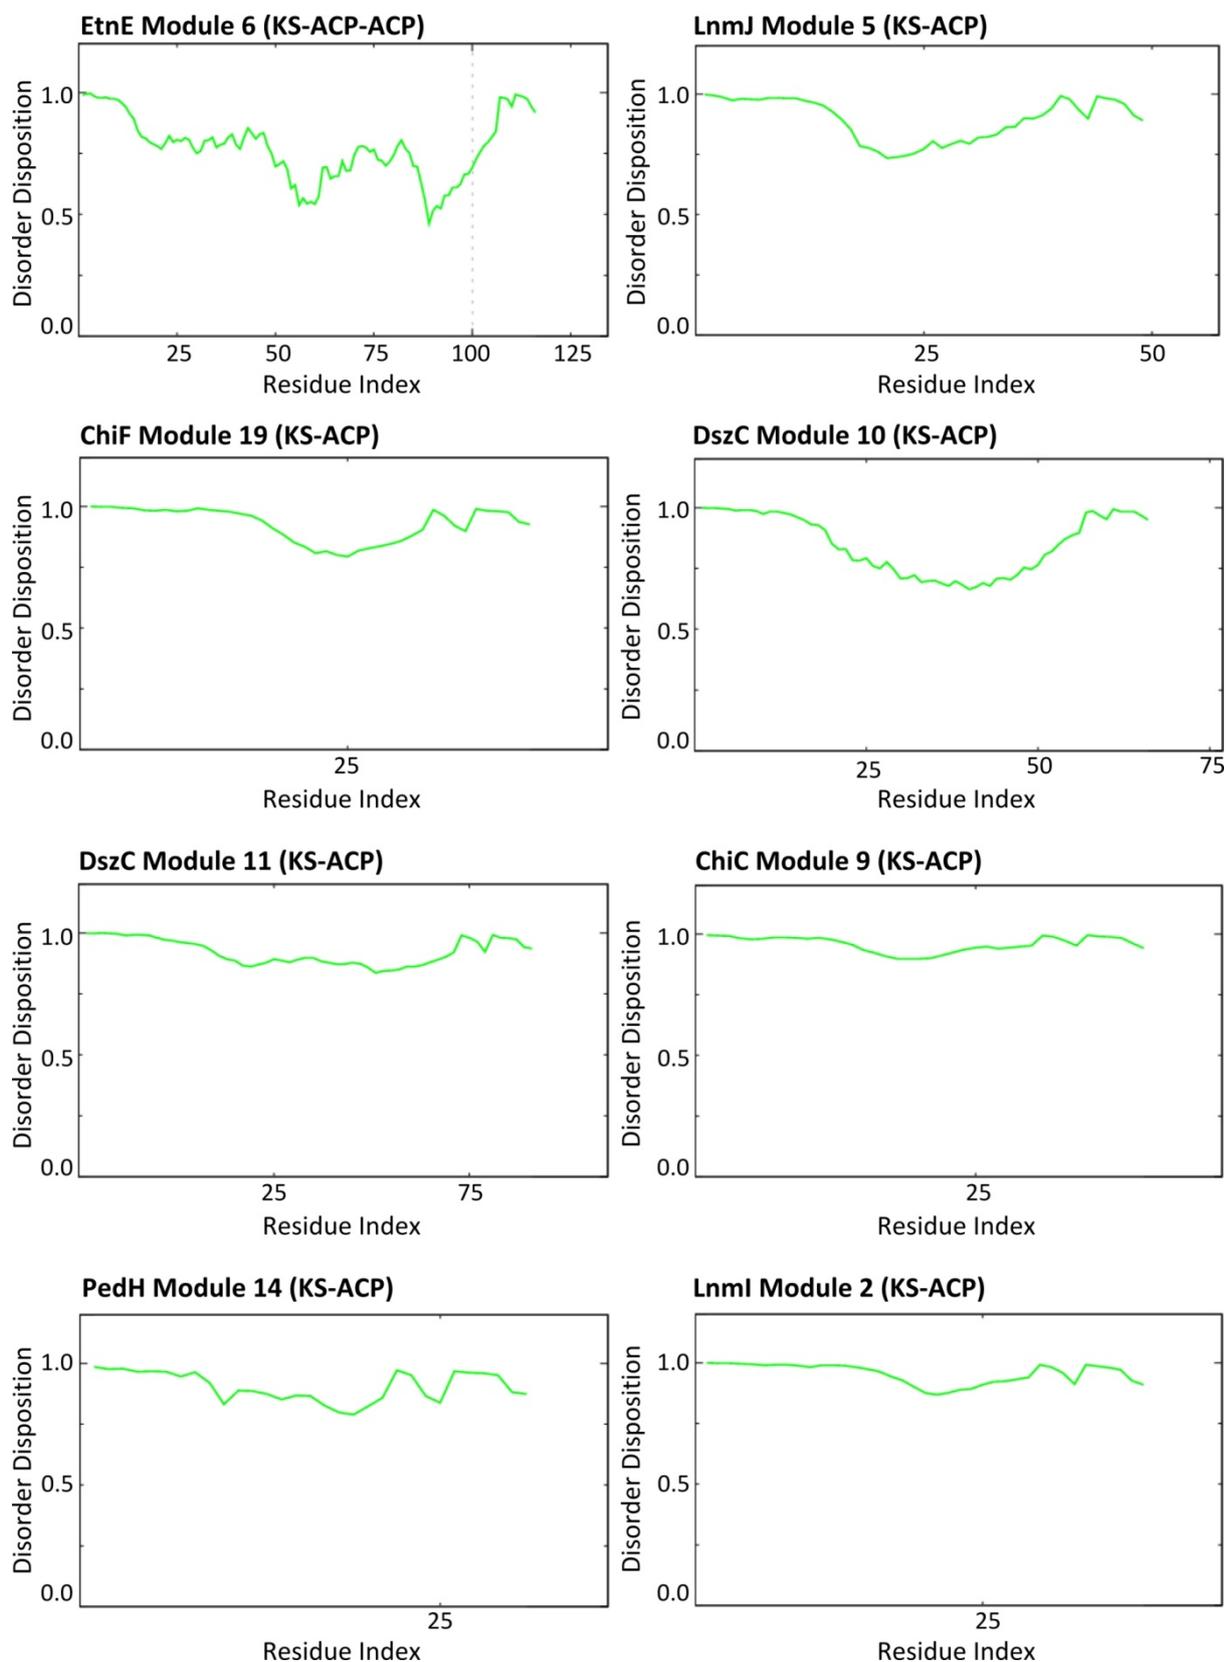

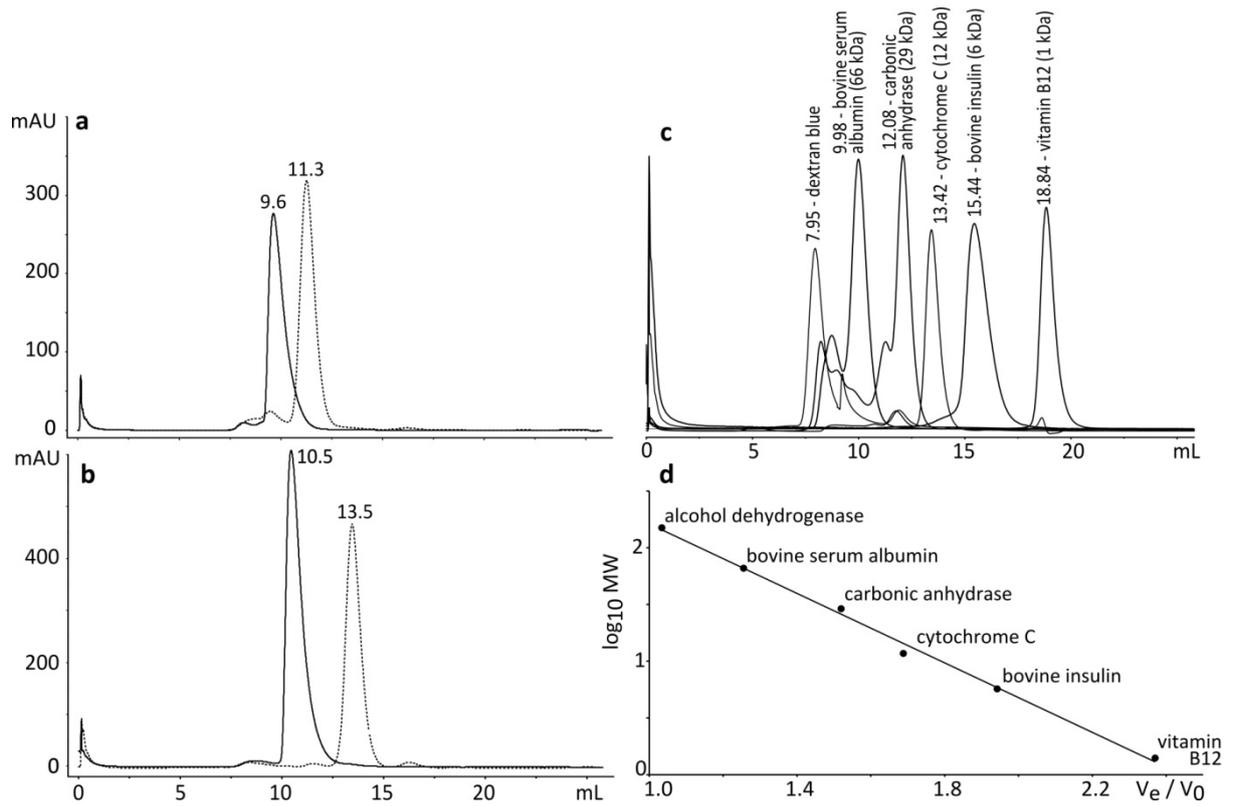

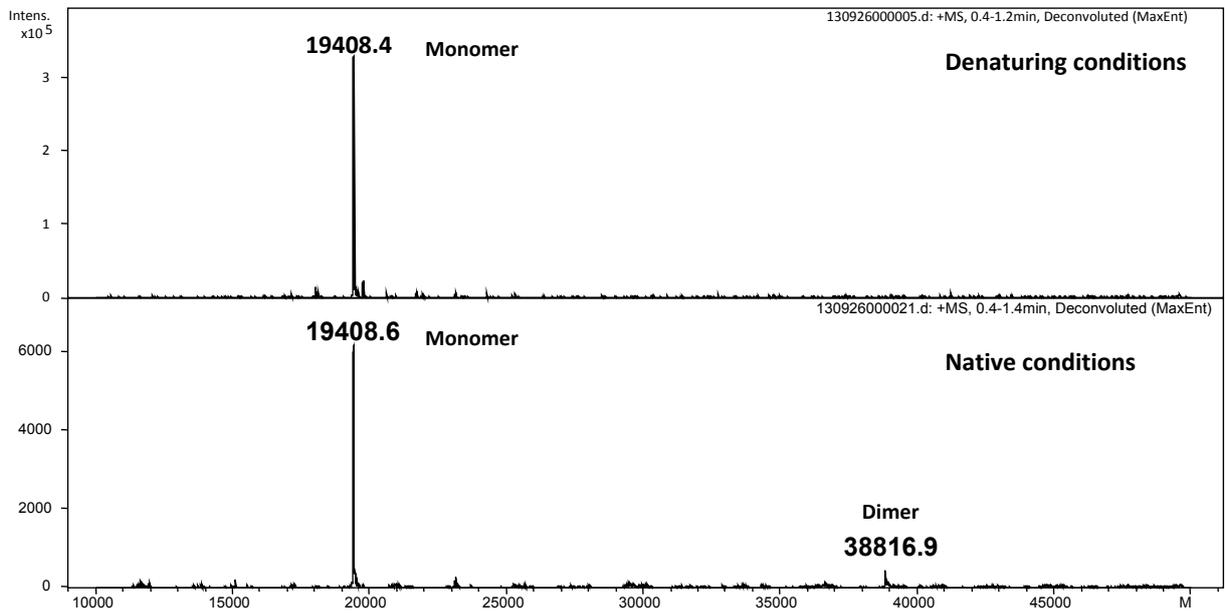

Fig. S6 Sequence analysis of the linker region following the ‘post-AT Linker’ (referred to as the ‘post-post-AT-linker’ (Fig. 3)) in various *trans*-AT PKS. (a) Analysis of the amino acid composition of the 159 residue post-post-AT linker of VirA module 5 reveals a sequence bias consistent with an intrinsically disorder region.⁴ (b) Disorder propensity analysis by PONDR-FIT⁵ of the post-post-AT linker from VirA module 5 (<http://www.disprot.org/metapredictor.php>). (c) Alignment of the post-post-AT linker

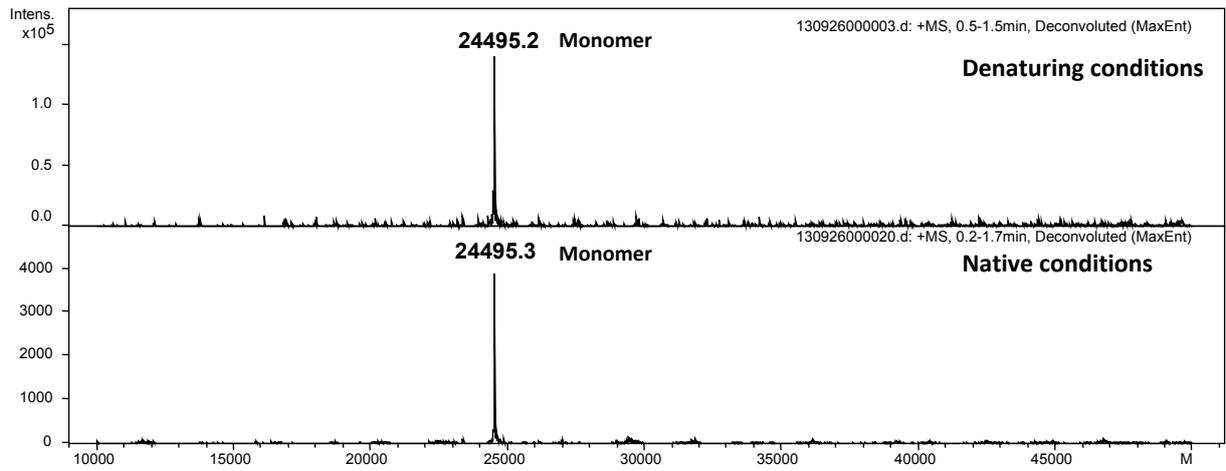

from a selection of KS-(ACP)_n modules from *trans*-AT PKS. The subunit name, module number and its ACP composition are indicated. The linker lengths are given in the table, with the two extremes highlighted in pink. (d) Comparison of the linker regions following the post-AT linker in virginiamycin and pristinamycin modules 5. (e) PONDR-FIT analysis of the linker regions in (c) which show the highest disorder propensity. Key: Vir, virginiamycin; Sna, pristinamycin; Pks, bacillaene from *Bacillus subtilis*; Etn, etnangien; Onn, onnamide; Dif, difficidin; Ozm, oxaxolomycin; Ped, pederin; Mmp, mupirocin; Kir, kirromycin; Lnm, leinamycin; Bae, bacillaene from *B. amyloliquefaciens*; Bry, bryostatin; Dsz, disorazol; chi, chivosazol; Alb, albicidin.

Fig. S7 Analysis of the effect on the oligomerization state of various constructs of the presence of the putative dimerization domain (DD). FPLC traces of (a) ACP_{5a}-ACP_{5b}-DD (solid line) and ACP_{5a}-ACP_{5b} (dotted line), (b) ACP_{5b}-DD (solid line) and ACP_{5b} (dotted line), and (c) the calibration standards (Sigma) dextran blue, bovine serum albumin, carbonic anhydrase, cytochrome C, bovine insulin, vitamin B12 (alcohol dehydrogenase omitted for clarity). All samples were analyzed on a Superdex 75 10/30 column (GE) equilibrated with 50 mM sodium phosphate (pH 7.5), 250 mM NaCl. (d) The calibration curve plotting the ratio of elution volume (V_e) to column void volume (V_0) against log molecular weight. The curve was described by the formula $y = -1.53x + 3.74$, with $R^2 = 0.996$. The calculated molecular weights are shown in the **Table** below. (e) Analysis by mass spectrometry of ACP_{5a}-ACP_{5b} under native and denaturing conditions shows that the construct is almost exclusively monomeric, with a small proportion of dimer (estimated at 5%) present. (f) Analysis by mass spectrometry of ACP_{5a}-ACP_{5b}-DD shows that the construct is exclusively monomeric under all conditions. (g) Analysis by mass spectrometry of ACP_{5b} shows an estimated 18% of dimer under native conditions. (h) Analysis by mass spectrometry of ACP_{5b}-DD reveals a small proportion (estimated at 9–11%) of dimer under both native and denaturing conditions, suggesting the presence of a covalent link between the monomers (disulfide bridge?). Panels e–h show the deconvoluted neutral mass spectra obtained using maximum entropy analysis.

Construct	Expected MW / kDa	Estimated MW / kDa	Ratio of MW in presence/absence of the DD
ACP _{5b}	9.2	14.1	
ACP _{5b} -DD	14.3	53.5	3.8
ACP _{5a} -ACP _{5b}	19.4	37.4	
ACP _{5a} -ACP _{5b} -DD	24.5	77.0	2.1

The calculated molecular weights of monomeric constructs with and without the putative dimerization domain, compared to the estimated molecular weights derived from calibrated gel filtration (**Fig. S7**).

Commentary on the table

The presence of the dimerization domain (DD) on ACP_{5b} gives a molecular weight approximately four-fold greater than the ACP_{5b} alone, while that of the ACP_{5a}-ACP_{5b} is more than doubled by addition of the DD. It could be argued that the addition of the DD makes the proteins substantially more elongated, thus explaining the apparent increases in molecular weight; indeed, an elongated protein can elute at twice the volume of a

globular protein of the same molecular weight.⁶ However, the fact that the ACPs even in the absence of the DD give estimated molecular weights in great excess of their calculated weights, shows that the constructs are already in an extended conformation. Thus, our analysis instead supports a change in oligomerization state in the presence of the putative dimerization element.

Table S1 Summary of SAXS Data

Construct	R_g (Guinier) (Å) ^a	R_g (GNOM) (Å) ^a	D_{max} (GNOM) (Å) ^b	χ^2 (DAMMIN) ^c	χ^2 (SASREF) ^c	χ^2 (MONSA) ^c
KS	33.1 ± 0.5	32.6	105	1.689	1.333	1.421
ACP _{5a} -ACP _{5b}	29.0 ± 0.2	30.7	103	1.785	24.981	nd
KS-ACP _{5a} -ACP _{5b}	56.5 ± 0.7	60.9	230	2.813	nd	1.885
KS-ACP _{5a} -ACP _{5b} -DD	69 ± 1	72.5	279	2.204	nd	nd
ACP _{5b} -DD	37.0 ± 0.3	37.7	140	1.231	nd	nd
ACP _{5a} -ACP _{5b} -DD	43.5 ± 0.2	46.5	170	1.366	nd	nd

^a R_g is the radius of gyration derived from the atomic models using the program PRIMUS. For experimental data, R_g is given by the Guinier approximation⁸

^b D_{max} is the maximal particle diameter derived from the distance distribution function ($P(r)$) using the program GNOM⁹

^c χ^2 is the discrepancy between the experimental SAXS profile and the theoretical calculated curve using the programs DAMMIN,⁹ SASREF¹⁰ or MONSA¹⁰

nd: not determined

Table S2 NMR and Refinement Statistics for ACP_{5a}

	Protein
NMR distance and dihedral constraints	ACP _{5a}
Distance constraints	
Total NOE	1968
Intra-residue	374
Inter-residue	1594
Sequential ($ i - j = 1$)	490
Medium-range ($ i - j < 4$)	566
Long-range ($ i - j > 5$)	538
Intermolecular	n/a
Hydrogen bonds	0
Total dihedral angle restraints	114
ϕ	57
ψ	57
Structure statistics	
Violations (mean and s.d.)	
Distance constraints (Å)	0.092 ± 0.012
Dihedral angle constraints (°)	0 ± 0
Max. dihedral angle violation (°)	0
Max. distance constraint violation (Å)	0.13
Deviations from idealized geometry	
Bond lengths (Å)	0.010 ± 0.001
Bond angles (°)	2.062 ± 0.018
Improper (°)	n/d
Average pairwise r.m.s. deviation** (Å)	6734–6811
Heavy	0.94 ± 0.10
Backbone	0.27 ± 0.06

**Pairwise r.m.s. deviation was calculated using 20 refined structures. n/a = not available; n/d = not determined.

Table S3 NMR and Refinement Statistics for ACP_{5b}

	Protein
NMR distance and dihedral constraints	ACP _{5b}
Distance constraints	
Total NOE	1846
Intra-residue	371
Inter-residue	1475
Sequential ($ i - j = 1$)	500
Medium-range ($ i - j < 4$)	522
Long-range ($ i - j > 5$)	453
Intermolecular	n/a
Hydrogen bonds	0
Total dihedral angle restraints	110
ϕ	55
ψ	55
Structure statistics	
Violations (mean and s.d.)	
Distance constraints (Å)	0.096 ± 0.023
Dihedral angle constraints (°)	0 ± 0
Max. dihedral angle violation (°)	0
Max. distance constraint violation (Å)	0.17
Deviations from idealized geometry	
Bond lengths (Å)	0.010 ± 0.001
Bond angles (°)	2.054 ± 0.018
Impropers (°)	n/d
Average pairwise r.m.s. deviation** (Å)	6836–6909
Heavy	1.15 ± 0.15
Backbone	0.38 ± 0.07

**Pairwise r.m.s. deviation was calculated among 20 refined structures. n/a = not available; n/d = not determined.
