#### General

<sup>1</sup>H NMR spectra were measured using Varian INOVA-300, 500, and 600 spectrometers and <sup>13</sup>C Varian INOVA-600 spectrometer in CDCl<sub>3</sub> and TCE-d<sub>2</sub>. Spectra were referenced using the residual solvent resonances as internal standards and reported in ppm. Single crystal X-ray diffraction studies were performed on a Bruker Apex2 CCD diffractometer. Commercially available reagents were used as received. The reported yields are for isolated crystals. *Caution: Arsenic and antimony compounds are highly toxic and should be handled with care!* (This accounts for the small scale of the reactions reported herein.) The preparation of 2,4,6-triethyl-1,3,5-benzenetrimethanethiol (H<sub>3</sub>L<sup>Et</sup>) was previously reported.<sup>1</sup>

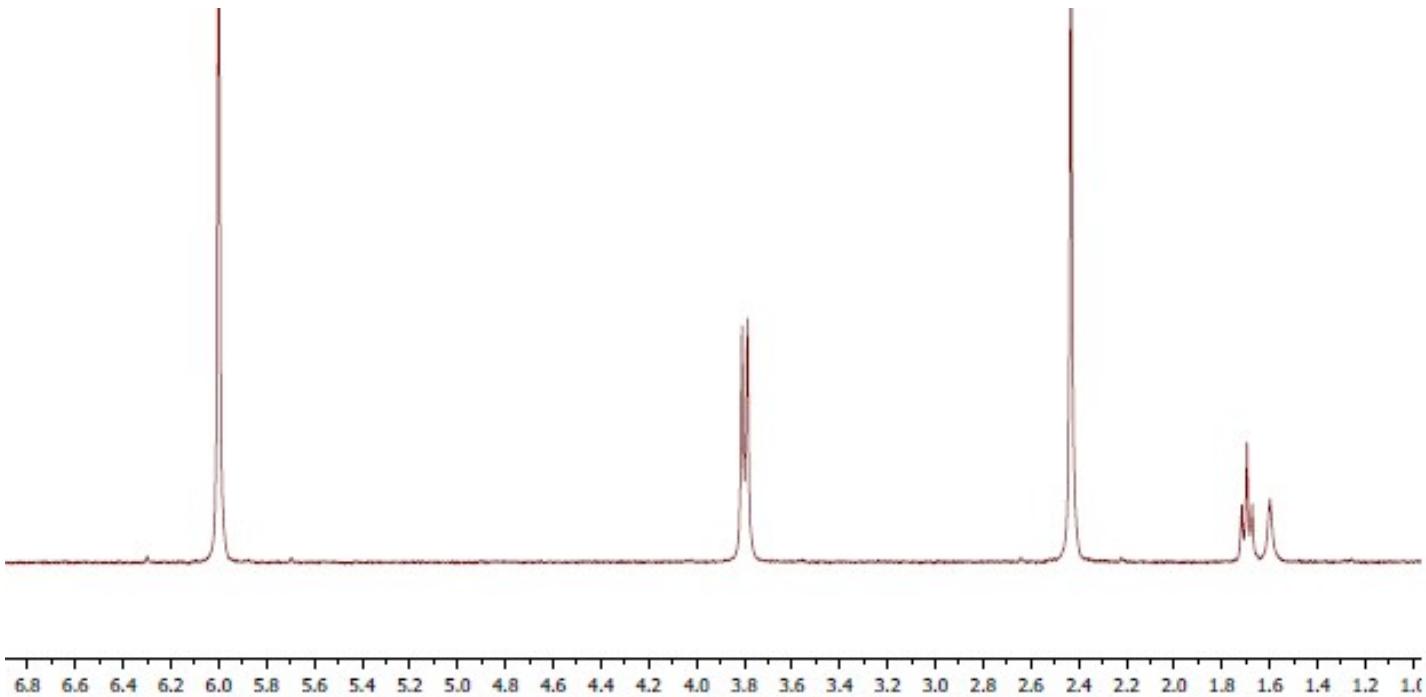

#### Ligand Synthesis

**Synthesis of 2,4,6-trimethyl-1,3,5-benzenetrimethanethiol.** 1,3,5-tris(bromomethyl)-2,4,6-trimethylbenzene (431.0 mg, 1.08 mmol) and thiourea (247.0 mg, 3.24 mmol) were dissolved in ethanol (20 mL) and stirred for 16 h at ambient temperature. The thiouronium salt was concentrated, and purged with N<sub>2</sub>. Degassed 2 M NaOH (150mL) was cannulated into the flask and the solution was stirred for 4 h at 80 °C. Degassed 6 M HCl (150mL) was cannulated while stirred on ice. Product was filtered to give a white solid (91%). <sup>1</sup>H NMR (300 MHz, TCE-d<sub>2</sub>): δ 3.81 (d, 6H, CH<sub>2</sub>, J = 6.6 Hz), 2.43 (s, 9H, CH<sub>3</sub>), 1.72 (t, 3H, SH, J = 6.4 Hz)

**Figure S1.**  $^1\text{H}$  NMR of 2,4,6-trimethyl-1,3,5-benzenetrimethanethiol

**Synthesis of 1,3,5-benzenetrimethanethiol.** 1,3,5-tris(bromomethyl)benzene (5.0 g, 14.01 mmol) and thiourea (6.4 g, 84.10 mmol) were dissolved in acetone (400 mL) and stirred for 16 h at 63 °C. The thiouronium salt was filtered, placed in a 1L round bottom flask and purged with  $\text{N}_2$ . Degassed 3 M NaOH (250mL) was cannulated into the flask and the solution was stirred for 4 h at 80 °C. The reaction mixture was removed from heat and degassed 9 M HCl (200mL) was cannulated into the flask alternating with degassed  $\text{CHCl}_3$  (150 mL) until pH 2. Product was extracted with 3X with  $\text{CHCl}_3$  and washed with brine. After the wash, solution was dried with  $\text{Na}_2\text{SO}_4$ , and filtered. The filtrate was concentrated to give a yellow oil (84%).  
 $^1\text{H}$  NMR (300 MHz,  $\text{CDCl}_3$ ):  $\delta$  7.17 (s, 6H,  $\text{C}_6\text{H}_3$ ), 3.73 (d, 6H,  $\text{CH}_2$ ,  $J$  = 7.6 Hz), 1.79 (t, 3H,  $\text{SH}$ ,  $J$  = 7.6 Hz)

## Antimony Macroyclics

### $\text{Sb}_3\text{L}^{\text{H}}_2\text{Cl}_3$ Synthesis

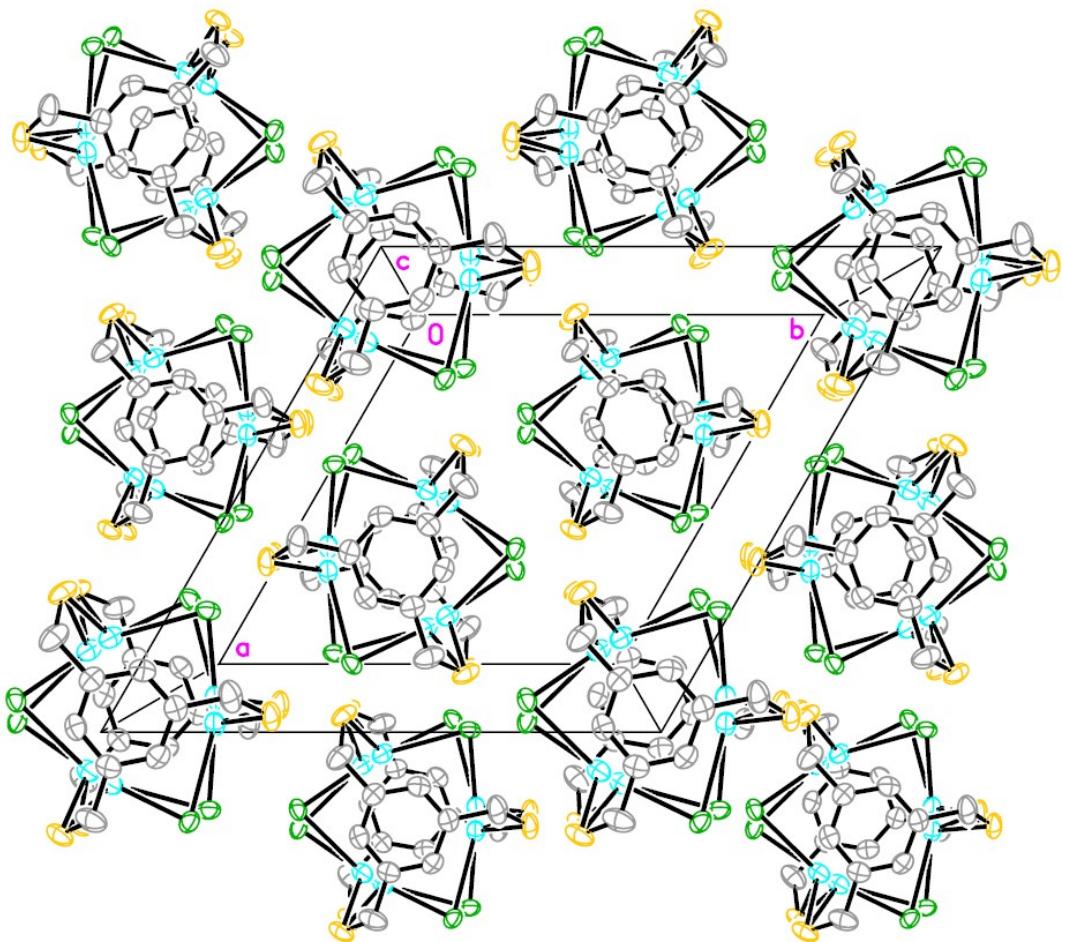

A solution of  $\text{H}_3\text{L}^{\text{H}}$  (45.4 mg, 0.18 mmol) in *o*-dichlorobenzene (3 mL) was combined with a solution of  $\text{SbCl}_3$  (140.3 mg, 0.61 mmol) in TCE (2 mL). The mixture was layered with benzene and yielded needles suitable crystals for X-ray diffraction in 2 weeks.  $^1\text{H}$  NMR (600 MHz, TCE- $d_2$ ):  $\delta$  7.27 (bs, 6H,  $CH$ ), 4.22 (bs, 12H,  $CH_2$ ).

**X-ray Crystallography.** Diffraction intensities were collected at 100(2) (ASR121, DWJ115), 193(2) K (as51o, DWJ105, DWJ112) and 173 K (as120) on a Bruker Apex2 CCD diffractometer using MoK $\alpha$  radiation,  $\lambda = 0.71073 \text{ \AA}$ , and CuK $\alpha$  radiation,  $\lambda = 1.54178 \text{ \AA}$ , (as120). Space groups were determined based on systematic absences (as51o, DWJ112, DWJ115, asr121 and AS120) and intensity statistics (DWJ105). Absorption corrections were applied by SADABS[\*]. Structures were solved by direct methods and Fourier techniques and refined on  $F^2$  using full matrix least-squares procedures. All non-H atoms were refined with anisotropic thermal parameters. H atoms in all structures were refined in calculated positions in a rigid group model. In the crystal structure of as120 there are two opposite molecule orientations in a 50:50 ratio. In the structure of DWJ105 some relatively high peaks on the residual density map clearly indicate the existence of an opposite molecule orientation, but we could not find a solution for this disorder. The contribution from the second orientation seems to be quite minor. Diffraction from crystals of as120 for Mo radiation was very weak and a micro-focus Incoatec  $I\mu S$  Cu source was used for data collection. Solvent hexane, pentane and benzene molecules (in mh90a, mh116, and as120, respectively) are disordered over several positions. These molecules were treated by SQUEEZE [\*\*]. Corrections of the X-ray data by SQUEEZE (223, 193 and 136 electron/cell, respectively for mh90a and mh116 and as120); the required values of 200, 168 and 252 electron/cell for four hexane and pentane molecules and six benzene molecules in the full unit cells. The benzene molecules in as120 are disordered over three positions and refinement shows that these positions may not be fully occupied. All calculations were performed by the Bruker SHELXTL (v. 6.10) package [\*\*\*].

## Computational Details

All calculations were performed with the Gaussian 09 package<sup>a</sup> at the MP2 level of theory. LANL2DZ was used as a basis set for all atoms;<sup>b</sup> the basis set LANL2DZ is the Los Alamos National Laboratory ECP plus a double zeta valence on Sb, As, S and Cl.<sup>c</sup> All optimizations were performed with C<sub>1</sub> symmetry with the default SCF convergence cutoffs.

## Results

Calculations on the methylated derivatives show that for both As and Sb, the symmetric form is lower in energy than the asymmetric form. The energy difference is 3.63 kcal/mol for As and 4.46 kcal/mol for Sb.

**Figure S27.** Representative optimized geometries (MP2/LANL2DZ) for the symmetric (left) and asymmetric (right) configurations are shown for As.
