Some Details of Experiments

Polypropylene/polystyrene/polyamide 6 (PP/PS/PA6) ternary blends without and with compatibilizer are compared to the simulation system. The blends are prepared by melt-blending in the Rheocord Haake Batch Mixer at 230°C, then the sample is smoothed by a freezing microtome (Leica EM-UC7) with a glass knife and the PS phase is etched using dichloromethane. A scanning electron microscope (FEI Quanta 200) is used to observed the morphology of the blend. The compatibilizers PP-g-PS and PP-g-GMA are prepared by melt grafting experiments¹ and the grafting ratio is about 0.5% ~ 1.0%. All materials are commercial available. Detailed and systematical methods and results regarding the experiments will be published elsewhere.

Fig. S1 shows the representative morphologies from simulations and experiments of PP/PS/PA6 ternary blends, where the interaction parameters of simulations between homopolymers are chosen as $\gamma_{AB} = 2.37$, $\gamma_{AC} = 5.43$ and $\gamma_{BC} = 2.68$, corresponding to the experimental system.²

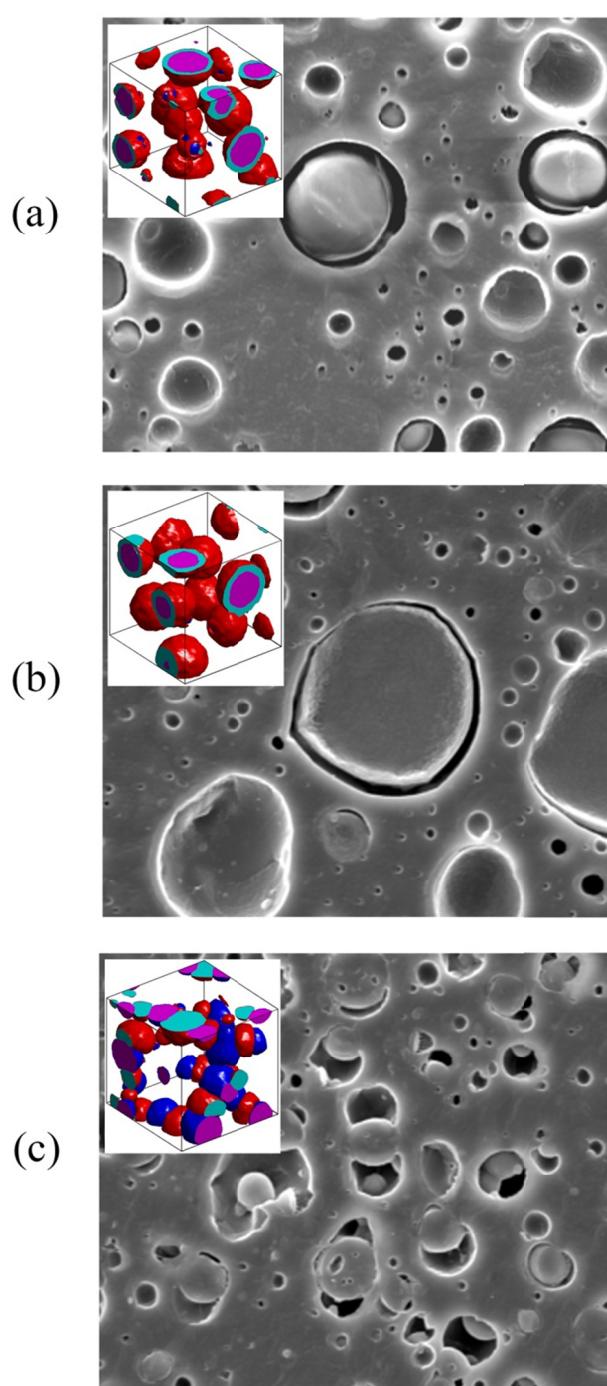

Figure S1. Scanning electron micrographs of PP/PS/PA6 ternary blends after extraction of the PS phase. (a) Without compatibilizer. (b) With compatibilizer PP-g-PS. (c) With compatibilizer PP-g-GMA. The insets are the simulated morphologies of A/B/C ternary blends without compatibilizer (a), with compatibilizer A-g-B (b), and with compatibilizer A-g-C (c).
