Immiscible lipids control the morphology of patchy
emulsions

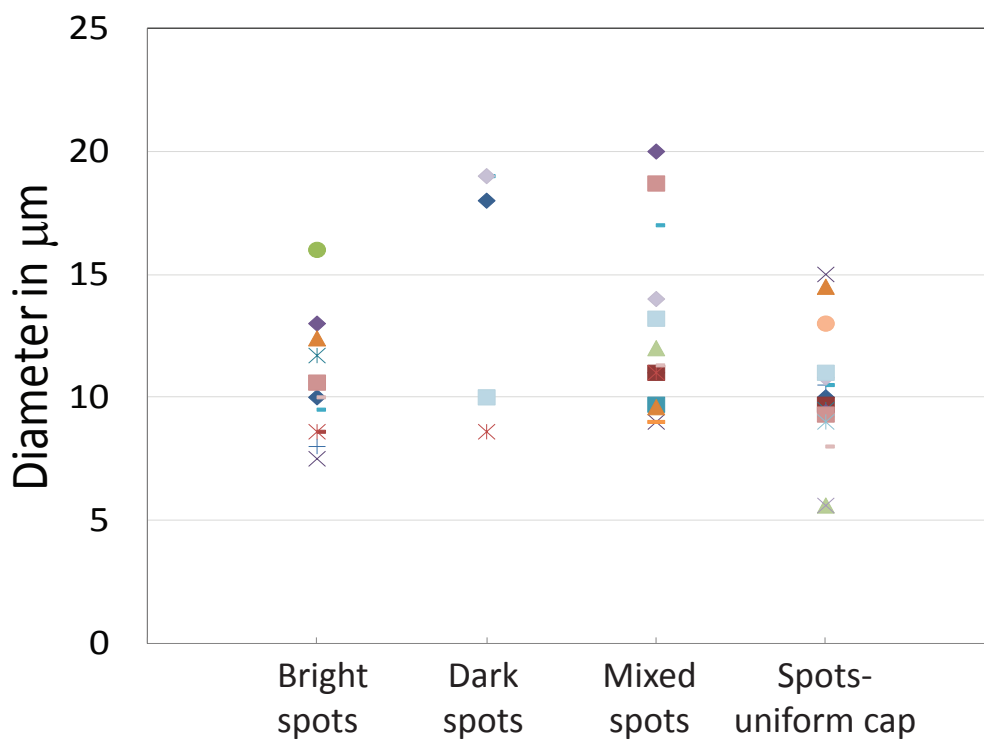

Figure 1: **Domain morphologies are independent of droplet sizes in polydisperse emulsions obtained from coarse emulsification.** A polydisperse emulsion was prepared with the lipid composition DOPC:Cholesterol 70:30. A 3D transparent packing of such droplets was analyzed by measuring the size and reporting the corresponding domain morphology for each droplet in the sample. No obvious correlation between the size of the droplet and its topology can be identified from this analysis.
