FIG. S1: Mean square internal distances for nanocomposites containing attractive nanoparticles (R = 1) for N = 20. Data corresponding to the different volume fraction ϕ are indicated in the legend.

FIG. S2: Mean square internal distances for nanocomposites containing attractive nanoparticles (R = 1) for N = 100. Data corresponding to the different volume fraction ϕ are indicated in the legend.

FIG. S3: Mean square internal distances for nanocomposites containing attractive nanoparticles (R = 1) for N = 200. Data corresponding to the different volume fraction ϕ are indicated in the legend.

FIG. S4: Mean square internal distances for nanocomposites containing repulsive nanoparticles (R = 1) for N = 200. Data corresponding to the different volume fraction ϕ are indicated in the legend.

FIG. S5: Mean square displacement of attractive nanoparticles of radius R = 2 in nanocomposites with entangled polymers N = 200. Data corresponding to the different volume fraction ϕ are indicated in the legend.
