#### 1. Dyes: Structures and Calibration Curves

The structures of methylene blue (MB) and methyl orange (MO) are shown in Figure S1, and UV-vis calibration curves for the dyes are presented in Figure S2.

Fig. S1. Structures of the methylene blue and methyl orange dyes.

Fig. S2. UV-vis calibration curves for MB (left) and MO (right).

## 2. Characterisation of amino-MIL-101(Al)

Amino-MIL-101(Al) was characterised by X-ray diffraction (XRD), N<sub>2</sub> adsorption-desorption, and thermogravimetry, as shown in Figures S3–S5. X-ray photoelectron spectroscopy (XPS) data for amino-MIL-101(Al) is discussed and shown on page S9.

**Fig. S3.** (a) Experimental XRD pattern of amino-MIL-101(Al); (b) Simulated pattern of MIL-101 phase.

**Fig. S4.** Pore size distribution curve of amino-MIL-101(Al). Calculated from the adsorption branch of the N<sub>2</sub> adsorption-desorption isotherm (acquired at −196 °C) using BJH method.

**Fig. S5.** Thermogravimetric analysis of amino-MIL-101(Al) under air flow of 60 mL min<sup>−1</sup> at a heating rate of 5 °C min<sup>−1</sup>.

### 3. Adsorption of methylene blue (MB)

**Fig. S6.** Digital images of before and after adsorption of MB by amino-MIL-101(Al).  $[MB]_0 = 50$  ppm,  $t = 6$  h,  $m_{\text{amino-MIL-101(Al)}} = 0.01$  g.

**Fig. S7.** UV-visible spectra of MB solutions after exposure to 5 mg of amino-MIL-101(Al) at 30 °C. (a)  $[MB]_0 = 20$  ppm, (b)  $[MB]_0 = 30$  ppm, (c)  $[MB]_0 = 40$  ppm.

**Fig. S8.** Plots of (a) pseudo-second-order and (b) pseudo-first-order kinetics for MB adsorption over 5 mg amino-MIL-101(Al) at 30 °C and [MB]<sub>0</sub> = 20, 30 or 40 ppm. (c) Three replicates of the adsorption of MB over 5 mg amino-MIL-101(Al) at 30 °C and [MB]<sub>0</sub> = 40 ppm, with accompanying kinetic fits.

The maximum adsorption capacity of amino-MIL-101(Al) for MB compared favourably to those of many reported sorbents. A comparison is given in Table S1.

**Table S1.** Maximum adsorption capacities of methylene blue (MB) on various adsorbents.

| Adsorbent                                                    | Maximum Adsorption Capacity, $Q_o$ (mg g <sup>-1</sup> ) | Reference                                                       |

**Fig. S9.** Comparison of UV-visible spectra of a MB solution during adsorption over 5 mg amino-MIL-101(Al) at different temperatures. (a)  $[MB]_0 = 20$  ppm, (b)  $[MB]_0 = 30$  ppm, (c)  $[MB]_0 = 40$  ppm.

**Fig. S10.** Comparison of the UV-visible spectrum of MB (20 ppm) with those of dyes desorbed from MOF-MB composites during sonication in water for 12 h. MOF-MB composites were prepared by adsorption of MB ( $[MB]_0 = 20$  ppm) on 5 mg of amino-MIL-101(Al) for 12 h, at 30, 40 or 50 °C.

**Fig. S11.** Reuse of amino-MIL-101(Al) as a sorbent for methylene blue: (a) Isotherms for MB adsorption over fresh (1<sup>st</sup> adsorption) and used amino-MIL-101(Al) (5 mg) after 12 h at 30 °C; and (b) Langmuir plots of the isotherms of (a).

#### 4. Rate data and treatment

Pseudo-second-order kinetic treatment: The dye adsorption as a function of time was fit to the pseudo-second-order rate equation shown in its derivative and integrated forms in Eqs. S1 and S2, respectively.<sup>1</sup>

$$\frac{dq_t}{dt} = k_2(q_e - q_t)^2 \quad \text{Eq. S1}$$

$$\frac{t}{q_t} = \frac{1}{k_2 q_e^2} + \frac{1}{q_e} t \quad \text{Eq. S2}$$

Where  $q_e$  is the amount of dye adsorbed ( $\text{mg g}^{-1}$ ) at equilibrium, and  $q_t$  the amount adsorbed at time  $t$ . When  $t/q_t$  is plotted against  $t$ , the second-order kinetic constant ( $k_2$ ) can be calculated as  $k_2 = \text{slope}^2/\text{intercept}$ .

Pseudo-first-order kinetic treatment: The dye adsorption as a function of time over the period  $t = 5\text{--}60$  min was fit to the pseudo-first-order rate equation (integrated form shown in Eq. S3).

$$\ln(q_e - q_t) = \ln q_e - k_1 t \tag{Eq. S3}$$

From Equation S3, the kinetic constant ( $k_1$ ) of a pseudo-first-order reaction is equal to the slope of a plot of  $\ln(q_e - q_t)$  vs.  $t$ .

**Table S2.** Pseudo-second-order kinetic ‘constants’ ( $k_2$ ) for the adsorptions of MB and MO on amino-MIL-101(Al) at  $[\text{dye}]_0 = 20$  or 30 ppm, along with correlation constants ( $R^2$ ) for the plots of  $t/q_t$  vs.  $t$  used to derive the values.

| Dye | Pseudo-second-order kinetics constants $k_2 (\text{g mg}^{-1} \text{min}^{-1})^a$ |       |                       |       |
|-----|-----------------------------------------------------------------------------------|-------|-----------------------|-------|
|     | 20 ppm                                                                            |       | 30 ppm                |       |
|     | $k_2$                                                                             | $R^2$ | $k_2$                 | $R^2$ |
| MB  | $8.61 \times 10^{-4}$                                                             | 0.996 | $1.06 \times 10^{-3}$ | 0.997 |
| MO  | $6.23 \times 10^{-5}$                                                             | 0.992 | $8.30 \times 10^{-5}$ | 0.973 |

<sup>a</sup>The data were not completely described by either first- or second-order models, so the rate ‘constants’ depend on  $[\text{dye}]_0$ . Values are derived from data in Figures S8a and S14a. See Table 1 for  $[\text{dye}]_0 = 40$  ppm.

**Table S3.** Pseudo-first-order kinetic ‘constants’ ( $k_1$ ) for the adsorptions of MB and MO on amino-MIL-101(Al) at  $[\text{dye}]_0 = 20$  or 30 ppm, along with correlation constants ( $R^2$ ) for the plots of  $\ln(q_e - q_t)$  vs.  $t$  used to derive the values.

| Dye | Pseudo-first-order kinetics constants $k_1 (\text{min}^{-1})^a$ |       |         |       |
|-----|-----------------------------------------------------------------|-------|---------|-------|
|     | 20 ppm                                                          |       | 30 ppm  |       |
|     | $k_1$                                                           | $R^2$ | $k_1$   | $R^2$ |
| MB  | 0.0432                                                          | 0.992 | 0.0584  | 0.989 |
| MO  | 0.00369                                                         | 0.995 | 0.00540 | 0.972 |

<sup>a</sup>The data were not completely described by either first- or second-order models, so the rate ‘constants’ depend on  $[\text{dye}]_0$ . Values are derived from data in Figures S8b and S14b. See Table 1 for  $[\text{dye}]_0 = 40$  ppm.

## 5. XPS analysis of amino-MIL-101(Al) before and after MB adsorption

X-ray photoelectron spectroscopy (XPS, ESCALAB250Xi, Thermo scientific, UK; X-ray source: monochromated Al K $\alpha$ , Power: 164 W (10.8 mA and 15.2 kV); binding energy reference: C1s = 285.0 eV for adventitious hydrocarbon) was used to examine the chemical states of different elements in amino-MIL-101(Al) before and after MB adsorption (Figure S12). The XPS results are detailed in Tables S4 and S5.

**Table S4.** XPS data for amino-MIL-101(Al).

**Fig. S15.** Plots of (a) pseudo-second-order and (b) pseudo-first-order kinetics for MO adsorption over 5 mg amino-MIL-101(Al) at 30 °C and  $[MB]_0 = 20, 30$  or 40 ppm. (c) Three replicates of the adsorption of MO over 5 mg amino-MIL-101(Al) at 30 °C and  $[MB]_0 = 40$  ppm, with accompanying kinetic fits.

**Fig. S16.** (a) Isotherms for MO adsorption over 5 mg of amino-MIL-101(Al) for 12 h at 30, 40 and 50 °C; (b) Langmuir plots of the isotherms in (a); (c) van't Hoff plot of the Langmuir constants  $b$  as a function of temperature, used to calculate the  $\Delta H$  and  $\Delta S$  of the MO adsorption over amino-MIL-101(Al).

**Fig. S17.** Reuse of amino-MIL-101(Al) as a sorbent for methyl orange. (a) Isotherms for MO adsorption over fresh (1<sup>st</sup> adsorption) and used amino-MIL-101(Al) (5 mg) after 12 h at 30 °C; and (b) Langmuir plots of the isotherms of (a).

## 7. Comparison of MB and MO adsorption on amino-MIL-101(Al)

**Fig. S18.** Comparison between the rates of MB and MO adsorption over 5 mg of amino-MIL-101(Al) at 30 °C at  $[\text{dye}]_0$  = (a) 20 ppm; (b) 30 ppm; and (c) 40 ppm.

**Fig. S19.** Pseudo-second-order kinetic treatment of MB and MO adsorption over 5 mg of amino-MIL-101(Al) at 30 °C and [dye]<sub>0</sub> = (a) 20 ppm; (b) 30 ppm; and (c) 40 ppm.

**Fig. S20.** Pseudo-first-order kinetic treatment of MB and MO adsorption over 5 mg of amino-MIL-101(Al) at 30 °C and  $[dye]_0 =$  (a) 20 ppm; (b) 30 ppm; and (c) 40 ppm.

## 8. Characterisation of amino-MIL-101(Al) after dye exposure

Samples of amino-MIL-101(Al) were exposed to MB or MO ( $[\text{dye}]_0 = 40 \text{ ppm}$ ) for 12 h at 50 °C, then separated from the solution by filtration and analysed using  $\text{N}_2$  physisorption and  $^{27}\text{Al}$  NMR. The results are shown in Figures S21 and S22, respectively.

**Fig. S21.**  $\text{N}_2$  adsorption–desorption isotherms of amino-MIL-101(Al) before adsorption, after MB adsorption, and after MO adsorption. Isotherms were acquired at  $-196 \text{ }^\circ\text{C}$ . Dye adsorptions used  $[\text{dye}]_0 = 40 \text{ ppm}$ ,  $T = 50 \text{ }^\circ\text{C}$ , and  $t = 12 \text{ h}$ .

**Fig. S22.** Magic-angle spinning (MAS)  $^{27}\text{Al}$  NMR spectra of amino-MIL-101(Al) before adsorption, after MB adsorption, and after MO adsorption. Recorded at 182.49 MHz, spinning at the magic angle at 20 kHz at ambient temperature. Data was acquired using a single pulse ( $\sim 14^\circ$ ,  $\pi/12$  pulse) with a 1-s recycle delay. Dye adsorptions used  $[\text{dye}]_0 = 40 \text{ ppm}$ ,  $T = 50 \text{ }^\circ\text{C}$ , and  $t = 12 \text{ h}$ .

## 9. Adsorption of MB on MIL-101(Al)

**Fig. S23.** (a) Isotherms for MB adsorption over 5 mg of MIL-101(Al) for 12 h at 30, 40 and 50 °C; (b) Langmuir plots of the isotherms in (a) and (inset) van't Hoff plot of the Langmuir constants  $b$  as a function of temperature.
