## Experimental Section

Caution: Proper safety precautions should be taken when handling these compounds. Laboratories and personnel should be properly grounded, and safety equipment such as Kevlar gloves, leather coats, face shields, and ear plugs are recommended.

General methods: All chemical reagents and solvents (analytical grade) were used as supplied unless otherwise stated. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were measured with a Bruker Avance III 500 MHz Digital NMR Spectrometer operating at $500,126 \mathrm{MHz} .{ }^{15} \mathrm{~N}$ NMR spectrum was recorded on a Bruker Avance 300 instrument $\left({ }^{15} \mathrm{~N}: 30 \mathrm{MHz}\right)$. FT-IR spectra were recorded on a BOMEM MB Series 154 S FTIR spectrometer. Mass spectra were recorded on Finnigan TSQ Quantum ultra instrument using electro spray ionization (ESI) method. Elemental analysis was performed by on a Vario EL III recorder. The decomposition point was recorded on a DSC823 ${ }^{\mathrm{e}}$ at a heating rate of $5{ }^{\circ} \mathrm{C} \cdot \mathrm{min}^{-1}$ in closed Al containers with a nitrogen flow of $30 \mathrm{~mL} \cdot \mathrm{~min}^{-1}$. Sensitivity data were determined using a HGZ-1 drophammer and a BAM friction tester. The electrostatic sensitivity test was carried out using an Electric Spark Tester ESD JGY-50 III.

## X-ray Structural Analysis of 3

Single crystals of $\mathbf{3}$ suitable for X-ray crystallographic analysis were obtained by slowly evaporation from isopropanol at room temperature.

The X-ray diffraction measurements for $\mathbf{3}$ were carried out on a Rigaku RAXIS-RAPID imaging plate diffractometer at 291 K by using graphite-monochromated Mo $\mathrm{K} \alpha$ radiation $(\lambda=0.71075 \AA$ ). Data were collected by $\omega$ scan technique. The structure was solved by direct methods with SHELXS-97 and expanded by using the Fourier technique. The non-hydrogen atoms were refined anisotropically. The hydrogen atoms were located and refined. Please see its CIF files. Relevant data are given in Table S1.

## Computational Details

Calculations were carried out by using the Gaussian09 suite of programs. The geometry optimization and the frequency analysis were performed at the level of Becke three Lee-Yan-Parr (B3LYP) Functionals ${ }^{1}$ with $6-311+\mathrm{G}^{* *}$ basis set. ${ }^{2}$ All of the optimized structures were characterized to be local minima on the potential surface without any imaginary frequencies.

The predictions of heats of formation (HOF) adopt the hybrid DFT-B3LYP methods with $6-311+\mathrm{G}^{* *}$ basis set via designed isodesmic reactions. The isodesmic reaction processes, i.e., the
number of each kind of formal bond is conserved, are used with application of the bond separation reaction (BSR) rules. The molecule is broken down into a set of two heavy-atom molecules containing the same component bonds. The isodesmic reactions used to derive the HOF of the title compounds are in Scheme S1. The change of enthalpy for the reactions at 298 K can be expressed as

$$
\begin{equation*}
\Delta H_{298}=\sum \Delta_{\mathrm{f}} H_{\mathrm{P}}-\sum \Delta_{\mathrm{f}} H_{\mathrm{R}} \tag{1}
\end{equation*}
$$

where $\Delta_{\mathrm{f}} H_{\mathrm{R}}$ and $\Delta_{\mathrm{f}} H_{\mathrm{P}}$ are the HOF of reactants and products at 298 K , respectively, and $\Delta H_{298}$ can be calculated using the following expression:

$$
\begin{equation*}
\Delta H_{298}=\Delta E_{298}+\Delta(P V)=\Delta E_{0}+\Delta Z P E+\Delta H_{\mathrm{T}}+\Delta n R T \tag{2}
\end{equation*}
$$

where $\Delta E_{0}$ is the change in total energy between the products and the reactants at $0 \mathrm{~K} ; \Delta Z P E$ is the difference between the zero-point energies $(Z P E)$ of the products and the reactants at $0 \mathrm{~K} ; \Delta H_{T}$ is thermal correction from 0 to 298 K . The $\Delta(P V)$ value in eq (2) is the $P V$ work term. It equals $\Delta(n R T)$ for the reactions of ideal gas. For the isodesmic reaction, $\Delta n=0$, so $\Delta(P V)=0$. On the left side of Eq. (1), apart from target compound, all the others are called reference compounds. The HOF of reference compounds are available either from the experiments or from the high level computing like CBS-4M.

## Detonation Parameters

Detonation velocity ( $D$ ) and detonation pressure $(P)$ were evaluated by the semi-empirical Kamlet \& Jacobs formula ${ }^{5}$ as

$$
\begin{align*}
& P=1.558 \rho^{2} \Phi  \tag{1}\\
& D=1.01 \Phi^{1 / 2}\left(1+1.30 \rho_{0}\right)  \tag{2}\\
& \Phi=0.4889 \mathrm{~N}(\mathrm{MQ})^{1 / 2} \tag{3}
\end{align*}
$$

where $D$ is the predicted detonation velocity $(\mathrm{km} / \mathrm{s})$ and $P$ is the detonation pressure $(\mathrm{GPa}), \rho$ is the density of a compound $\left(\mathrm{cm}^{3} / \mathrm{mol}\right) . \Phi, \mathrm{N}, \mathrm{M}$ and Q are characteristic parameters of an explosive, Q is chemical energy of detonation $(\mathrm{kJ} / \mathrm{g})$. The experiment densities and the calculated heats of formation were used in computing the D and P values.
