Table S3: Comparison of detection limit reported in the present manuscript for detection of gold ions with other reported detection limits in the literature.

Paper Journal	System	Detection Limit
Present Manuscript	Fluorescent Aggregates H ₂ O/THF (6/4 v/v)	100 nM
Analyst, 2013, 138, 3638	Non aggregated form CH ₃ CN–HEPES buffer (1/1 v/v)	0.6 ppm
Org. Lett. 2012, 14, 5062	Non aggregated form (0.25% DMSO in HEPES)	0.4 μM
Chem. Commun. 2012, 48, 744	Non aggregated form EtOH/ PBS buffer (1/1 v/v)	320 nM
Chem. Commun. 2011, 47, 4703	Non aggregated form (0.3% DMF in PBS HEPES)	290 nM
Org. Lett. 2010, 12, 932	Non aggregated form (Ethanol)	64 ppb
Org. Lett. 2010, 12, 401	Non aggregated form CH ₃ CN/PBS buffer (1/1 v/v)	0.4 ppm
Chem. Commun. 2009, 7218	Non aggregated form EtOH–HEPES and DMSO–HEPES buffer (1/1 v/v)	100 ppb

General experimental Procedures:

All reagents were purchased from Aldrich and were used without further purification. THF was dried over sodium and benzophenone and kept over molecular sieves overnight before use. UV-vis spectra were recorded on a SHIMADZU UV-2450 spectrophotometer, with a quartz cuvette (path length, 1 cm). The cell holder was thermostatted at 25⁰ C. The fluorescence spectra were recorded with a SHIMADZU 5301 PC spectrofluorimeter. Scanning electron microscope (SEM) images were obtained with a field-emission scanning electron microscope (SEM CARL ZEISS SUPRA 55). Polarized optical microscope (POM) images were recorded on NIKON ECLIPSE LV100 POL. Elemental analysis (C, H, N) was performed on a Flash EA 1112 CHNS-O analyzer (Thermo Electron Corp.). ¹H was recorded on a JEOL-FT NMR-AL 300 MHz spectrophotometer using CDCl₃ as solvent and tetramethylsilane SiMe₄ as internal standards. UV-vis studies were performed in THF and H₂O/THF mixture. Data are reported as follows: chemical shifts in ppm (δ), multiplicity (s = singlet, d = doublet, br = broad singlet m = multiplet), coupling constants *J* (Hz), integration, and interpretation. Silica gel (60–120 mesh) was used for column chromatography.

Synthesis of Gold Nanoparticles. To a 3 ml solution of compound **3**, **4**, and **6** (0.2 mM) was added 0.1 M AuCl₃ (15 μL for **3**, 45 μL for **4**, 30 μL for **6**) in H₂O/THF (6:4, v/v). The reaction was stirred at room temperature for 2 min and formations of nanoparticles take place. These nanoparticles solution was used as such in the catalytic experiment.

Catalysis of *p*-nitroaniline. 300 μL of 1 mM *p*-nitroaniline, 300 μL of 10 mM NaBH₄ and 5 μL (2.5 nmol) of gold nanoparticles of derivative **3**, **4**, and **6** were mixed. After that, different volumes of deionized water were added to the reaction mixture to nullify the dilution effect. After stirring the reaction mixture, a colour change of the reaction mixture from yellow to colourless was observed which indicate the reduction of *p*-nitroaniline to *p*-phenylenediamine. The reduction of *p*-nitroaniline takes 5 min. in case of derivative **3**, 24 min. in case of **4** and 18 min. in case of derivative **6**. The formation of the reduced product *p*-phenylenediamine was confirmed from the ¹H-NMR spectra (in CDCl₃) of the product (see pS29). The reduction of *p*-nitroaniline was also carried out in excess. After the complete reduction, the product was purified by column chromatography and found to be in 98% yield. ¹H NMR (400 MHz, CDCl₃): δ = 3.29 [s, 4H, NH₂], 6.57 (s, 4H, ArH).

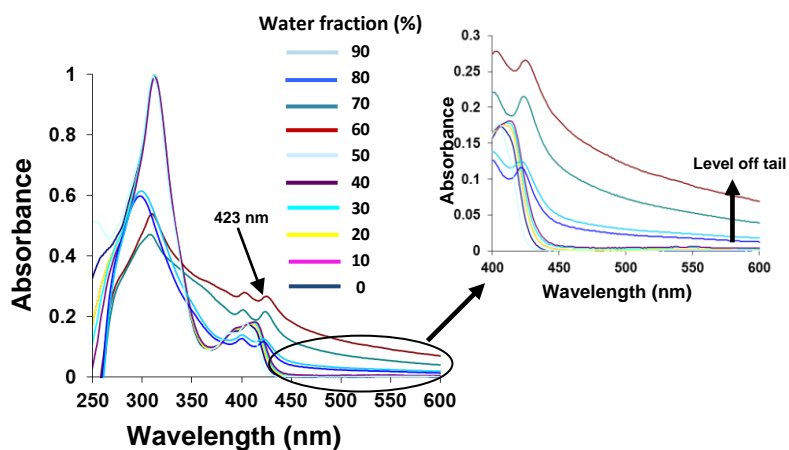

Fig. S1 Absorption spectra of derivative **3** (10 μM) showing the variation of absorption intensity in H₂O/THF mixture with different fractions of H₂O. Inset: enlarge UV-vis spectra of derivative **3** (10 μM) with the addition of H₂O/THF mixture in the range of 400-600 nm showing level-off long wavelength tail.

Fig. S5 UV-vis spectra of derivative **3** (10 μM) upon additions of 500 μM of various metal ions as their perchlorate salt in $\text{H}_2\text{O}/\text{THF}$ (6/4), buffered with HEPES, $\text{pH} = 7.0$.

Fig. S6 UV-vis spectra of derivative **3** (10 μM) upon additions of 500 μM of various metal ions as their chloride salt in $\text{H}_2\text{O}/\text{THF}$ (6/4), buffered with HEPES, $\text{pH} = 7.0$.

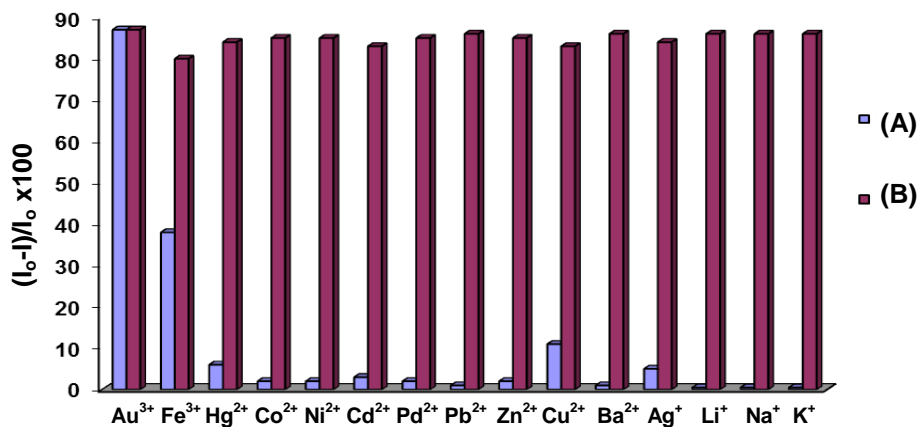

Fig. S7 Fluorescence response of derivative **3** (10 μM) to various cations (500 μM) in $\text{H}_2\text{O}/\text{THF}$ (6/4); buffered with HEPES, $\text{pH} = 7.0$; $\lambda_{\text{ex}} = 310 \text{ nm}$. Bars represent the emission intensity ratio $(I_0 - I)/I_0 \times 100$ (I_0 = initial fluorescence intensity at 476 nm; I = final fluorescence intensity at 476 nm after the addition of Au^{3+} ions). (A) The sky blue bars represent the addition of individual metal ions, (B) the brown bars represent the change in the emission that occurs upon the subsequent addition of Au^{3+} (500 μM) to the above solution.

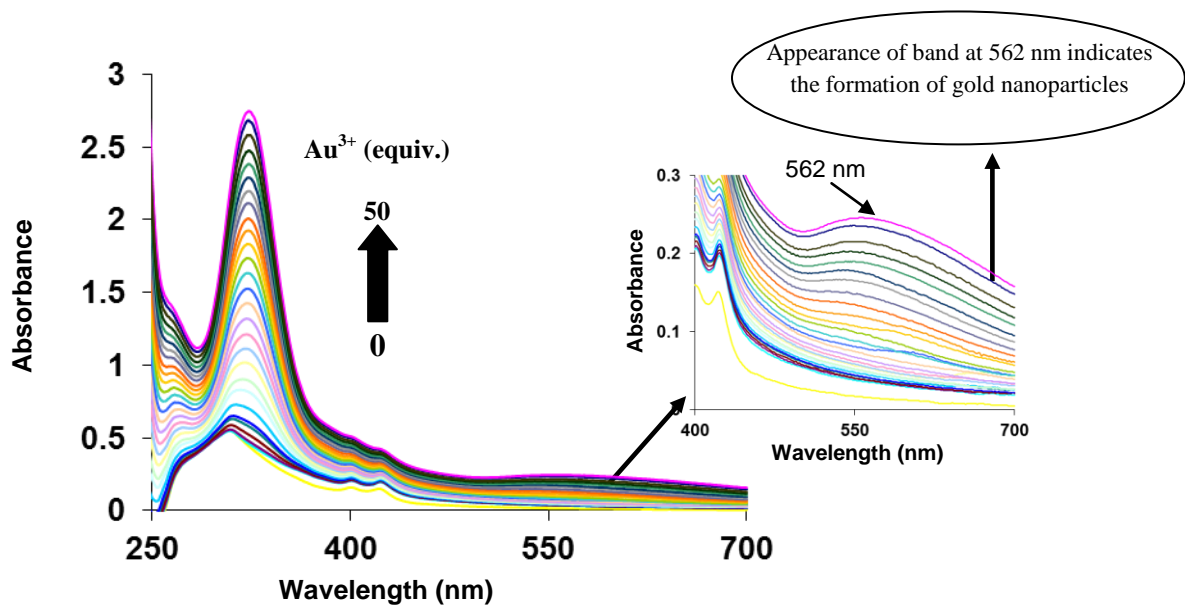

Fig. S8 UV-vis spectra of derivative **3** (10 μM) upon various additions of Au^{3+} ions in $\text{H}_2\text{O}/\text{THF}$ (6/4). Inset: enlarge UV spectra of compound **3** (10 μM) in the range of 400-700 nm.

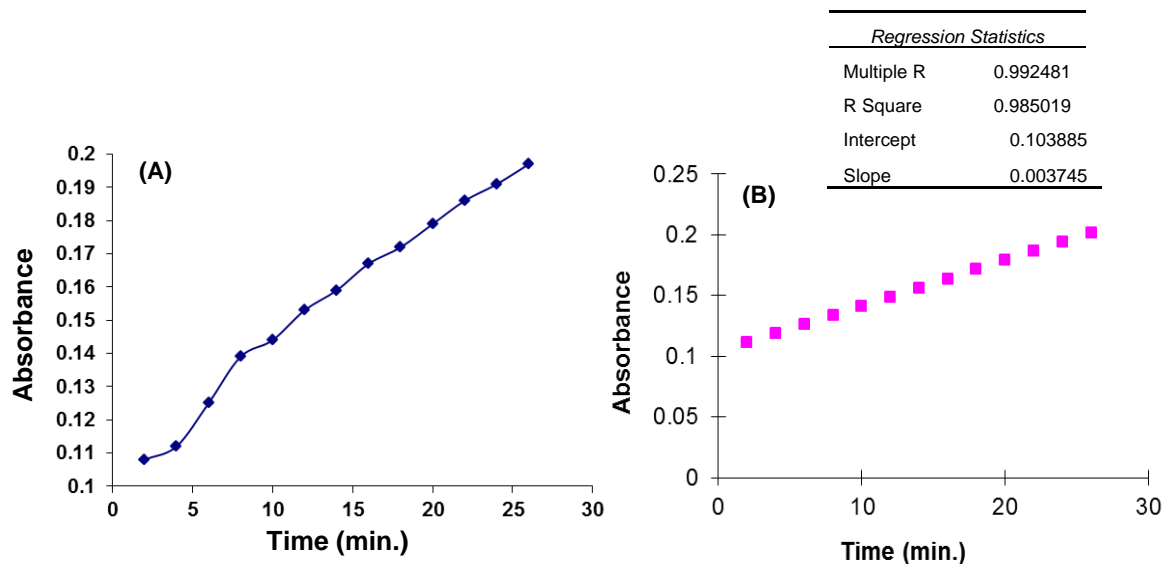

Fig. S9 Graphical representation of the rate of formation of gold nanoparticles of derivative **3**. (A) Time (min.) vs. absorbance plot at 562 nm (B) regression plot of A.

The first order¹ rate constant for the formation of gold nanoparticles was calculated from the changes of intensity of absorbance of aggregates of derivative **3** in the presence of Au³⁺ ions at different time interval².

From the time vs. absorbance plot at fixed wavelength 562 nm by using first order rate equation we get the rate constant = $k = \text{slope} \times 2.303 = 1.43 \times 10^{-3} \text{ Sec}^{-1}$.

Catalytic reduction of *p*-nitroaniline follows Pseudo-first-order kinetics.³ The apparent rate constants for the degradation of *p*-nitroaniline by gold nanoparticles of derivatives **3**, **4** and **6** listed in following table:

Gold nanoparticles	Rate constant
Derivative 3	$1.62 \times 10^{-2} \text{ sec}^{-1}$
Derivative 4	$5.64 \times 10^{-3} \text{ sec}^{-1}$
Derivative 6	$5.67 \times 10^{-3} \text{ sec}^{-1}$
