1. Experimental

a) Measurements of ¹³C NMR spectra

¹³C NMR spectrum was recorded on a JMN-ECA 500 spectrometer (JEOL). For ¹³C NMR spectrum measurements, CDCl₃ was used for an external referencing (77.23 ppm) and locking. For comparison, ¹³C NMR spectra of aqueous solutions of AcOH (0.40 mol/L), acac (0.40 mol/L), and 2-propanol (1.6 mol/L) were also measured.

b) Measurements of Raman spectra

The Raman spectra were recorded with laser Raman spectrometer (Jasco, NRS-7200); an argon ion laser at 532 nm was used.

c) Measurements of TG-DTA

Thermal analysis (TG-DTA) was conducted on dried powders on a TG-8120 (Rigaku). TG-DTA curves were recorded under air flow in the temperature range from 25 to 900°C.
