#### Supporting figures

**Figure S1:** Optical images of arrays of rolled-up  $\text{TiO}_2$  tubes with different outer diameters according to different thickness of  $\text{TiO}_2$ : the diameter is 3  $\mu\text{m}$  in (a), 4  $\mu\text{m}$  in (b) and 6  $\mu\text{m}$  in (c). In all the cases, titania membranes deposited at room temperature were rolled using a photoresist sacrificial layer. Insets: zoomed view of a single tube of each array.

## Supporting videos

**SI Video 1:** Rolling up process of  $\text{TiO}_2$  nanomembranes (thickness 16 nm). Pattern  $50 \times 50 \mu\text{m}$ . The sacrificial photoresist layer is removed by immersing the glass wafers in dimethyl sulfoxide (DMSO). The  $\text{TiO}_2$  nanomembranes roll up immediately into microtubes of  $50 \mu\text{m}$  length and about  $10 \mu\text{m}$  in diameter.

**SI Video 2:** Motion of an active  $\text{TiO}_2$  tubular micromotor in sodium acetate-acetic acid buffer (HAc 4.79 M/NaAc 0.21 M at  $\text{pH}=3.6$ ) at room temperature ( $23^\circ\text{C}$ ) under UV light irradiation.
