

Supporting Information:

Interpenetrating Morphology based on Highly Crystalline Small Molecule and PCBM Blends

Feng Liu, Lei Zhang, Yue Zhang, Stefan C. B. Mannsfeld, Thomas P. Russell*, Alejandro L. Briseno*

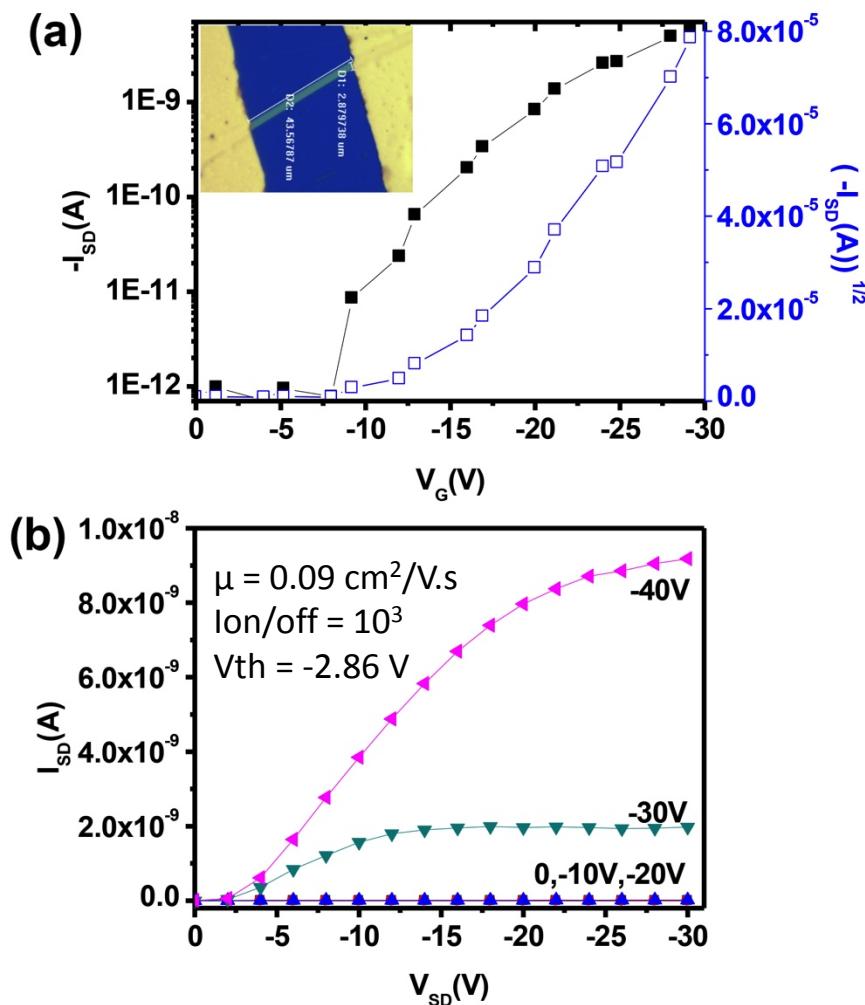

Figure S1. Single-crystal OFET device from a discrete TIPS-DBC nanowire.

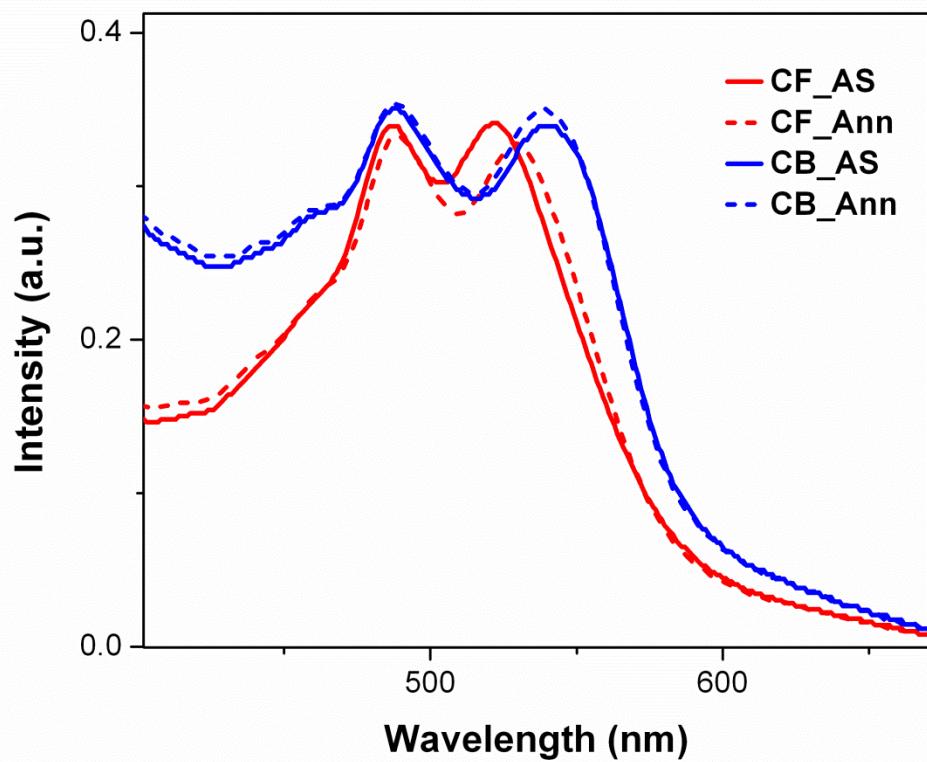

Figure S2. Enlarged absorption profiles of TIPS-DBC:PCBM blends.

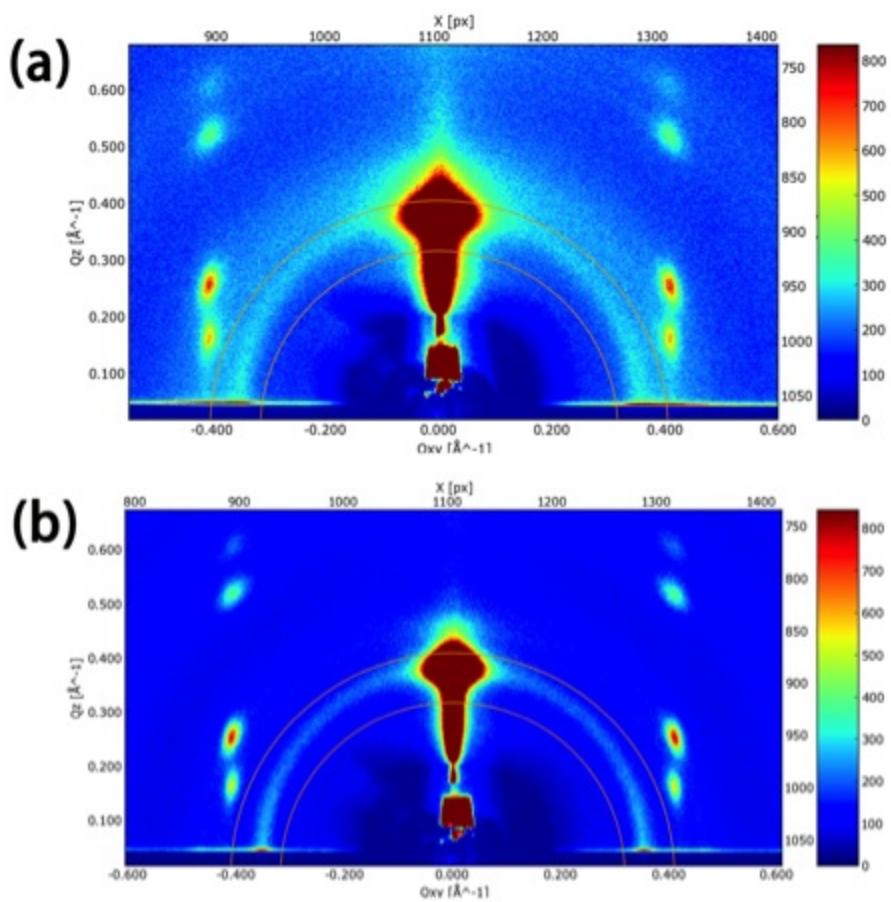

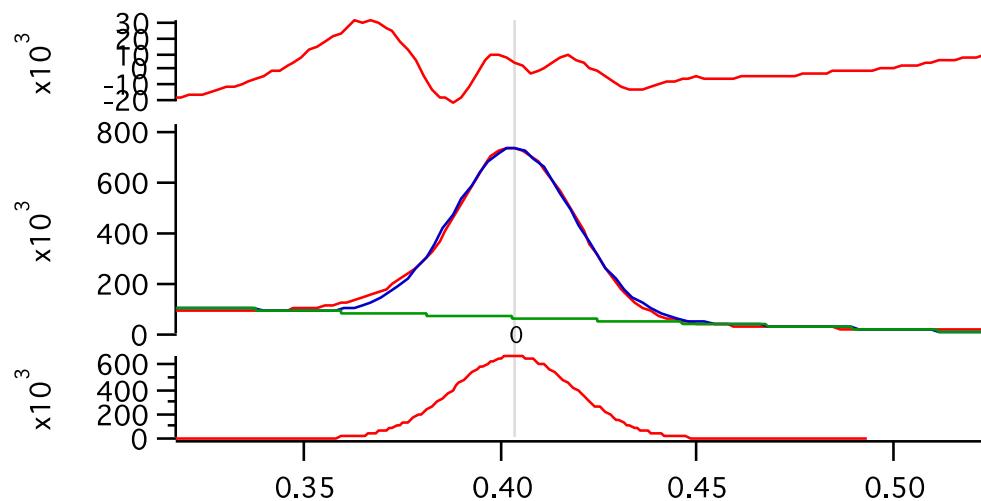

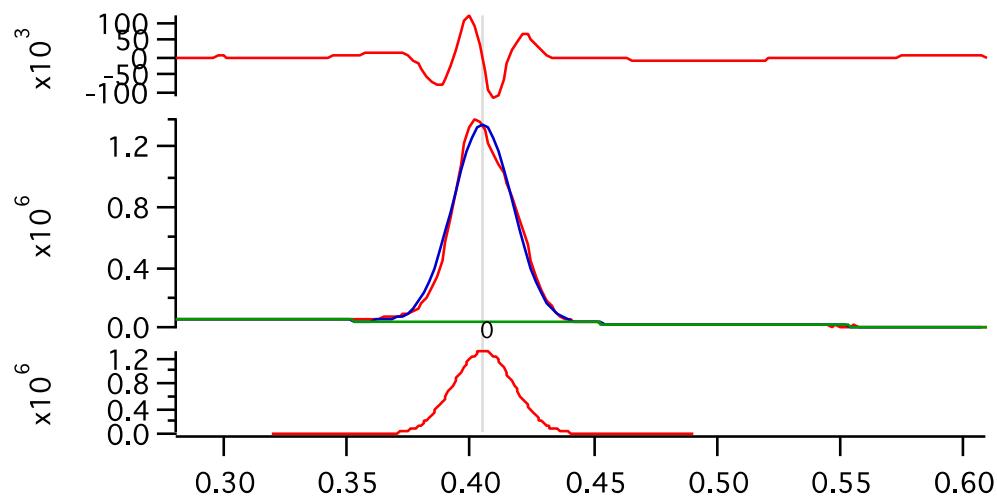

Figure S3. Enlarged GIXD of TIPS-DBC:PCBM blends processed from chloroform: (a) as spun; (b) annealed.

(a) Data fitting for CF processed film:

Location = 0.40345 +/- 0.0001063
Height = 6.7254e+05 +/- 4114.4
Area = 25914 +/- 200.61
FWHM = 0.036199 +/- 0.00027432

(b) Data fitting for CB processed film:

Location = 0.40531 +/- 0.00010874
Height = 1.3109e+06 +/- 10361
Area = 39737 +/- 351.33
FWHM = 0.028477 +/- 0.00026792

Figure S4. Fitting of GIXD of TIPS-DBC:PCBM blends processed from chloroform and chlorobenzene as spun samples.

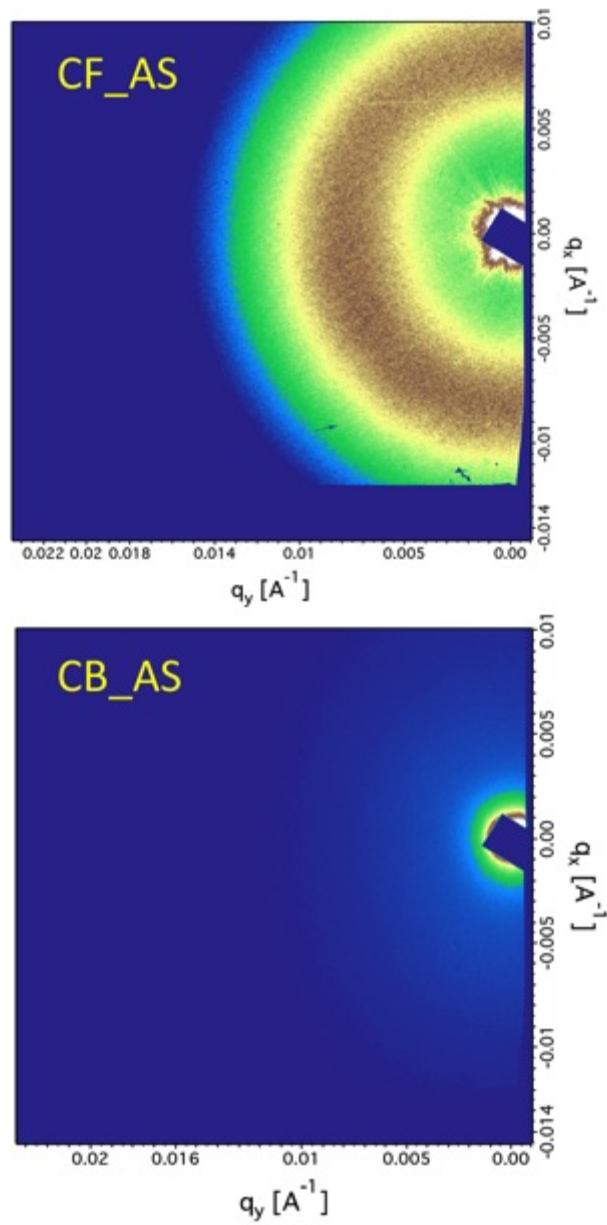

Figure S5. RSoXS scattering images of TIPS-DBC:PCBM blends processed from various conditions.

Table 1. Summary of device performances

	Voc (V)	Jsc (mA/cm ²)	FF (%)	PCE (%)
CF-as spun	0.720	-4.25	53.3	1.63
CF-annealed	0.720	-4.65	54.9	1.84
CB-as spun	0.009	-0.60	N.A.	N.A.
CB-annealed	0.002	-0.48	N.A.	N.A.
