XPS core level spectra of Cu 2p and Pd 3d are fitted using Gaussian-Lorentzian (G-L) mix function:

$$f(x) = \frac{I_0}{\{1 + M(x - x_0)^2 / \Gamma^2\} \exp\{(1-M) \ln 2 (x - x_0)^2 / \Gamma^2\}}$$

where I_0 , x_0 , x , \square , and M are the peak height, the peak position (binding energy), the binding energy, a parameter for the peak width, and the G-L mixing ratio, respectively. $M = 0$ gives a pure Gaussian curve, while $M = 1$ gives a pure Lorentzian curve.
