Scheme S2. Qualitative Jablonski diagram showing the rule for Pt(II) complexes. (a) Pt-3, (b) Pt-4, (c) Pt-5, (d) Pt-6. The relative energy levels of the states may vary from complex to complex. GS is the ground state ( $S_0$ ), <sup>1</sup>MLCT\* is the metal-to-ligand-charge-transfer excited state (for Pt-3 and Pt-4, the values are approximated with the parent complex Pt-a and Pt-b, due to overlap of the bands; for Pt-5 and Pt-6, the values are derived from the UV-Vis absorption spectra), ISC is intersystem crossing, <sup>3</sup>IL is the arylacetylide localized triplet excited state (for Pt-3 and Pt-4, the energy level was approximated with the phosphorescence emission wavelength; for Pt-5 and Pt-6, the energy levels are the DFT calculation results), <sup>1</sup>IL is the arylacetylide-localized singlet excited state (emissive singlet excited state),  $hv_F$  is the fluorescent emission,  $hv_P$  is the phosphorescent emission. The spin state of the excited electronic states or the relative energy levels dictates the possibility of a process.
